Price Four Shillings.

M.S. del et lith.

Aërua Curtisii, Oliv.

PLATE 2201.

ÆRUA CURTISII, Oliv.

AMARANTACEÆ. Tribe AMARANTEÆ.

Æ. Curtisii, Oliv. (*sp. nov.*); herba, caule pilosulo, foliis oppositis membranaceis oblongo-lanceolatis sensim acuminatis basi in petiolum angustatis supra obsolete pilosulis scabriusculis subtus sparse molliter pilosis nervis distinctis utrinque circa 7, floribus ♂ laxiuscule spicatis, spicis subumbellatim aggregatis, inflorescentiis terminalibus breviter pedunculatis ex dichotomiis superioribus ortis, bracteis scariosis parvis late ovatis persistentibus, bracteolis conformibus æquilongis, perianthio bractea 3-5-plo longiore 5-partito segmentis stramineis rigidiusculis fere glabris oblongo-lanceolatis acutis apiculatisve longitudinaliter valide nervosis, filamentis basi in cupulam coalitis deltoideo-subulatis staminodiis totidem (5) interpositis, stylo brevi, stigmate capitato, utriculo obovato-oblongo, semine oblique reniformi.

HAB. Malaya, Perak, *Curtis* (No. 2,712).

Folia 4-5½ poll. longa, 1-1½ poll. lata; *petiolus* ½-¾ poll. longus. *Inflorescentia* foliis brevior; *pedunculus* ¼-½ poll. longus; *spicæ* 1-1½ poll. longæ. *Flores* ⅙ poll. longi.

The comparative absence of the characteristic indumentum, and more especially the all but glabrous and somewhat coriaceous perianth-segments, renders this a marked species in *Ærua*, but the floral characters are those of that genus. A careful analysis of the flower was made by Dr. Stapf when comparing a considerable Malayan collection from our valued correspondent Mr. Curtis. He failed to identify it in the Kew Herbarium.—D. OLIVER.

Fig. 1. Extremity of flowering spike. 2. Detached flower. 3. Bract. 4. Perianth-segment. 5. Stamens and pistil. 6. Portion of staminal tube, with two anthers. 7. Vertical section of ovary. *All enlarged.*

M.S. del et lith.

Terminalia Oliveri, Brandis.

PLATE 2202.

TERMINALIA OLIVERI, *Brandis*.

COMBRETACEÆ. Tribe COMBRETEÆ.

T. Oliveri, *Brandis* (*sp. nov.*); arbor grandis, ramulis et foliis suboppositis, foliis integerrimis superne punctulatis longiuscule petiolatis ovato-ellipticis basi subinæqualibus acutis apice breviter acuminata submucronata, junioribus molliter sericeis, adultis glabrescentibus, nervis lateralibus (fortioribus) utrinque 8–10, venis plurimis eleganter reticulatis, floribus sessilibus hermaphroditis paniculatis luteolis, paniculis supra-axillaribus sericeo-pubescentibus folium æquantibus, bracteis linearibus flores apertos fere æquantibus longius persistentibus demum deciduis, ovario obscure 5-costato glaberrimo, calyce tenuiter membranaceo ad tertiam fere partem 5-fido extus glabro, intus in fundo piloso, segmentis triangularibus, staminibus 10, in fundo calycis circa discum pilosum dispositis sepalis alternis altius insertis, stylo exserto, stigma punctiforme, fructibus 5-alatis, alis membranaceis, radícula supera, cotyledonibus convolutis.

HAB. Upper Burma, Pakôkka district.—*J. W. Oliver*.

Folia $1\frac{1}{2}$ – $2\frac{1}{2}$ poll. longa, 1 – $1\frac{1}{2}$ poll. lata; petiolus $\frac{1}{2}$ poll. longus parce pilosulus; glandulæ nullæ. *Fructus* $\frac{3}{4}$ poll. longus.

This species is very similar to two species described by Presl in his 'Epimeliæ Botanicæ,' pp. 213–214, from specimens collected by H. Cuming, viz.: *T. polyantha* (No. 1516) and *T. parviflora* (No. 1439), both said to have come from Prov. Batangas, Luzon, Philippine Islands. Both, however, have tetramerous flowers, with four very indistinct calyx-segments (of *T. parviflora*, Presl says '*floribus obtuse quinquefidis*'), and minute early deciduous bracts. The (ripe) fruit of *T. parviflora* is 2-winged; that of *T. polyantha* (immature) is 4- sometimes 3-winged.

Mr. J. W. Oliver, the Conservator of Forests in Upper Burma, who sent me the specimens here figured, found the tree in flower in May 1891.

Mr. H. C. Hill, Conservator of Forests in Burma, who lately acted as Inspector-General of Forests, India, has kindly furnished me with the following notes regarding the appearance and geographical distribution of this interesting tree:—

A moderate-sized tree, attaining 40–50 feet, with a girth of 4–5 feet. Stem irregularly shaped, often channelled, somewhat like the Hornbeam: bark greenish grey. During the dry season the leaves turn red before falling. The bark is thick and brittle; its cells contain an abundance of starch and calcium-oxalate crystals, but, apparently, no tannin. The decoction of the bark gives a light-coloured extract which has been largely used to adulterate cutch (the extract of the heart-wood of *Acacia Catechu*), but is believed to be entirely ineffective as a tanning material.

It is a very common tree in the dry region of the Irawaddi valley, which commences north of the 19th degree N. lat., and extends as far as Mandalay. It is also found in the lower part of the Chindwin valley, and near the head waters of the Sitang valley. In this extensive dry region, with a mean annual rainfall of only 20–30 inches, *Terminalia Oliveri* is associated with Cutch in a thin open forest, from which the Cutch, being the more valuable tree, has been much cut out. The other trees found in this forest are: *Tectona Hamiltoniana*, *Shorea siamensis*, and *Terminalia tomentosa*.

From the Indian species of the section *Pentaptera* this tree differs in a remarkable manner in the small size of the leaves and fruit.—
D. BRANDIS.

Fig. 1. Two flowers, attached. 2. Calyx-tube, laid open. 3. Ovary. 4. Vertical section of same. 5. Fruit. *Excepting No. 5, all enlarged.*

M.S. del. et lith.

Cacoucia paniculata, Laws.

PLATE 2203.

CACOUCIA PANICULATA, Laws.

COMBRETACEÆ. Suborder COMBRETÆÆ.

C. paniculata, Lawson in Oliv. *Fl. Trop. Afr.* ii. 434; frutex scandens, foliis oblongo-ellipticis breviter acuminatis basi plus minus rotundatis glabris breviter petiolatis, paniculis amplis terminalibus ramis simplicibus divergentibus recurvisve cano- v. cinnamomeo-tomentellis, bracteis lanceolatis acuminatis pilosulis v. pubescentibus brevissime petiolatis, floribus pedicellatis, calycis tubo oblique tubulari-campanulato pubescente dentibus ovato-deltaideis acutis, petalis calycem paullo superantibus ellipticis unguiculatis acutiusculis plus minus pubescentibus, staminibus antipetalis longioribus, filamentis superne glabris, stylo basi disco plicato margine ciliato circumdato, ovario sulcato tomentoso-pubescente, ovulis c. 4 longe funiculatis, fructibus siccis pentapteris late ellipticis alis coriaceis margine membranaceis.

HAB. W. Tropical Africa, Gaboon River, Mann, Soyaux (Nos. 108, 158); Expedition to interior of Yoruba, Millson (No. 34).

Folia 4-5½ poll. longa, 1½-2 poll. lata, petiolus $\frac{1}{4}$ - $\frac{1}{3}$ poll. longus. *Paniculæ* 1-2 ped. longæ. *Bracteæ* $\frac{1}{2}$ - $\frac{3}{4}$ poll. longæ. *Flores* cum ovario $\frac{3}{4}$ -1¼ poll. longi, decurvi.

The fruit of this plant was unknown at the time of its publication (*l.c.*), but specimens since received from M. Soyaux and, recently, through the good offices of H.E. Governor Sir A. Moloney, show a fruit which is very different from that of Aublet's South American species, which has an ovoid or lanceolate-ovoid, more or less 5-angled fruit with corky pericarp, 2-2¾ inches in length. We have what may be *C. paniculata* from Niamniam-land, communicated by Dr. Schweinfurth. *C. platyptera*, Welw., MSS. from Angola, I take to be identical.—D. OLIVER.

Fig. 1. Calyx, laid open. 2. Petal. 3. Stamens. 4. Ovary and style. 5. Longitudinal section of ovary. *All enlarged.*

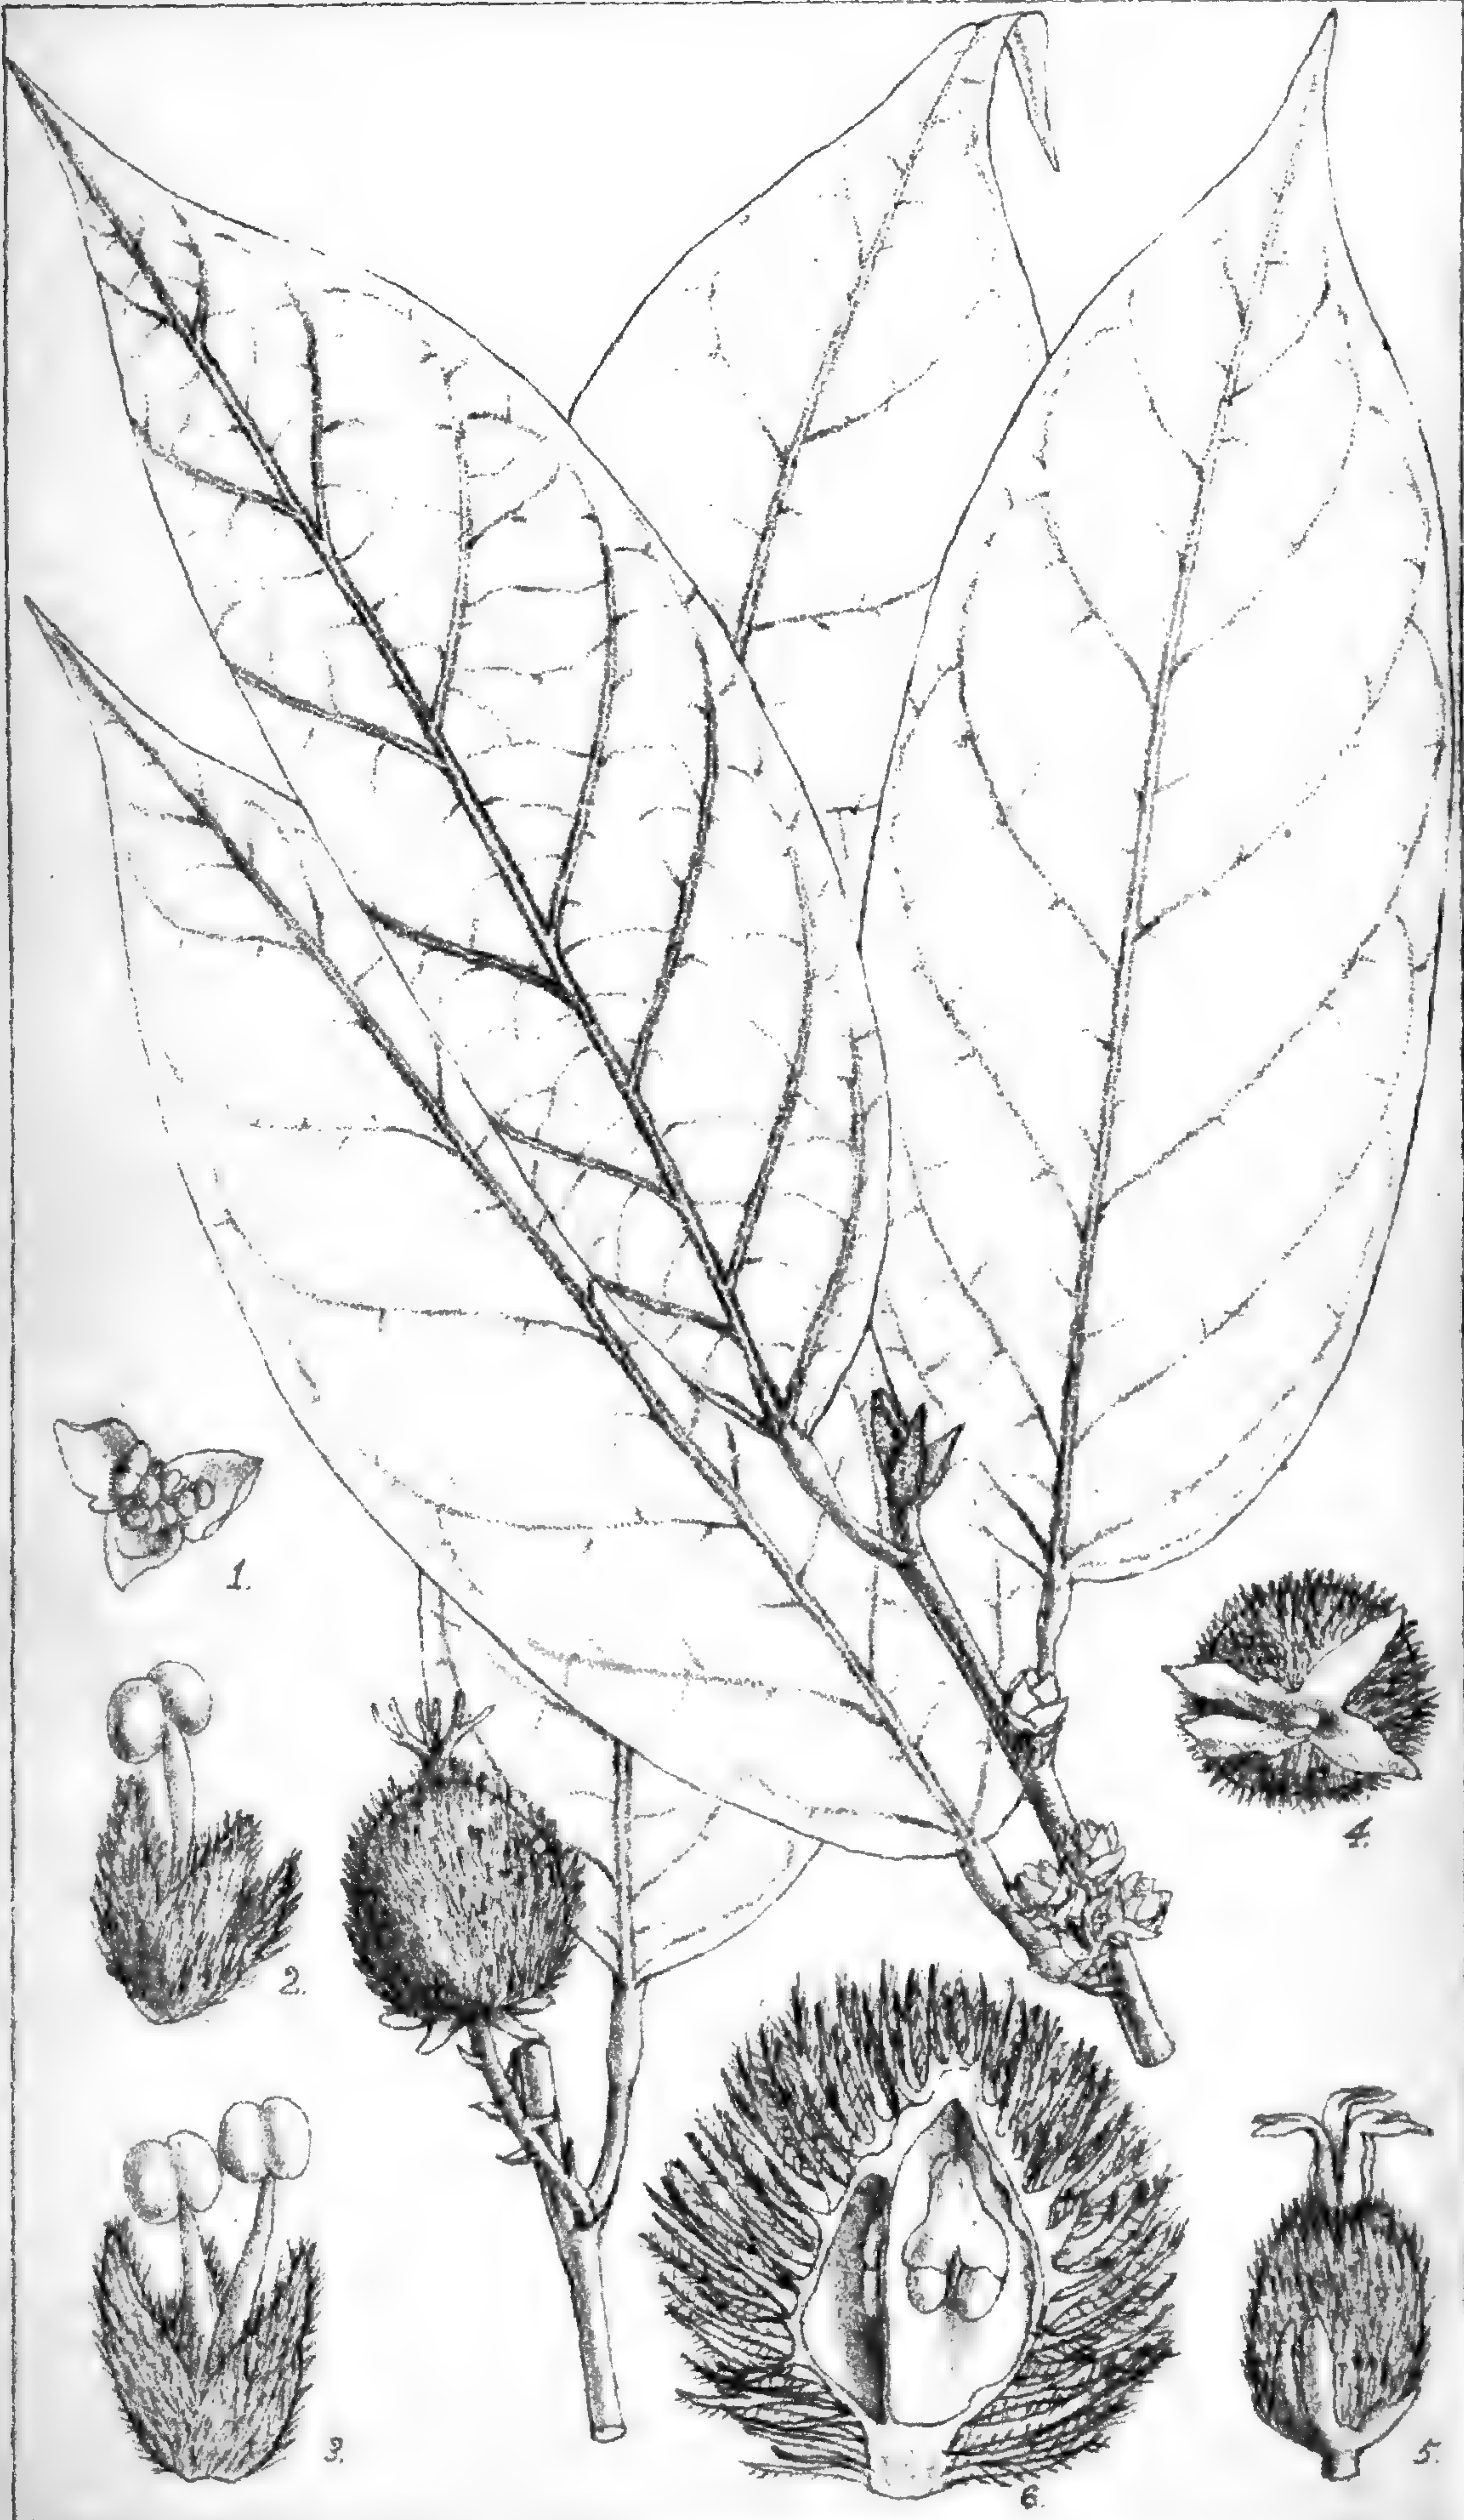

PLATE 2204.

APOROSA BOURDILLONII, *Stapf*.

EUPHORBIACEÆ. Tribe PHYLLANTHÆÆ.

A. Bourdillonii, *Stapf* (*sp. nov.*); arbuscula, ramulis breviter tomentellis deinde glabrescentibus, foliis oblongo-ellipticis obtusiuscule acuminatis costa nervisque secundariis puberulis exceptis glabratis, stipulis caducis, ♂ inflorescentia amentacea, amentis solitariis v. parce fasciculatis axillaribus, perianthio minuto inæqualiter 2-3-lobo membranaceo, staminibus sæpius 2 liberis, ovarii rudimento minimo, floribus ♀ in axillis superioribus solitariis pedunculo bracteato suffultis, perianthio inæqualiter 4-partito segmentis bracteis consimilibus, ovario ovoideo processibus linearibus demum accrescentibus strigillosis obsito.

HAB. Travancore; moist forest in the low country, *T. Fulton Bourdillon* (No. 9).

Ramuli graciles crassitie pennæ corvinæ, annotini brunneo-grisei tenuiter rimosi, hornotini foliiferi brunnei. *Folia* alterna petiolata basi rotundata tenuiter coriacea, nervis subtus prominulis secundariis utrinque 7-9, venulis inconspicuis, $4\frac{1}{2}$ -6 poll. longa, $1\frac{1}{2}$ - $1\frac{3}{4}$ poll. lata; petiolus $\frac{1}{2}$ poll. longus. *Stipulæ* oblongæ acuminatæ fulvo-tomentosæ, $\frac{1}{4}$ - $\frac{1}{3}$ poll. longæ. *Flores* ♂ glomerulati, glomerulis in amentis c. 10-12 bracteatis arcte approximatis; bracteæ ovatæ subacutæ pallide brunneæ puberulæ et ciliatæ, 1- $1\frac{1}{2}$ lin. longæ. *Antheræ* globosæ loculis contiguis parallelis. *Flores* ♀ pedunculati, pedunculo bracteato $\frac{1}{3}$ - $\frac{1}{2}$ poll. longo. *Ovarium* a me visum maxime evolutum $\frac{1}{3}$ - $\frac{3}{4}$ poll. longum; stigmata crassa profunde bifida.

This species represents a peculiar type which may well form a new section of *Aporosa*, or even a new genus altogether. The structure of the ovary, however, is, apart from the shaggy indumentum, exactly that of *Aporosa*. Professor Baillon, to whom I forwarded a sketch of the plant and of my dissections, is also inclined to refer this species to *Aporosa*.—O. STAPF.

Fig. 1. Glomerulus of staminate flowers in bud. 2 and 3. Staminate flowers. 4. Pistillate flower from below. 5. The same, side view. 6. Longitudinal section of young fruit.—*All enlarged.*

M.S. del et lith

Engleria africana, O. Hoffm var

PLATE 2205.

ENGLERIA AFRICANA, *O. Hoffm.*, var.

COMPOSITÆ. Tribe ASTEROIDEÆ.

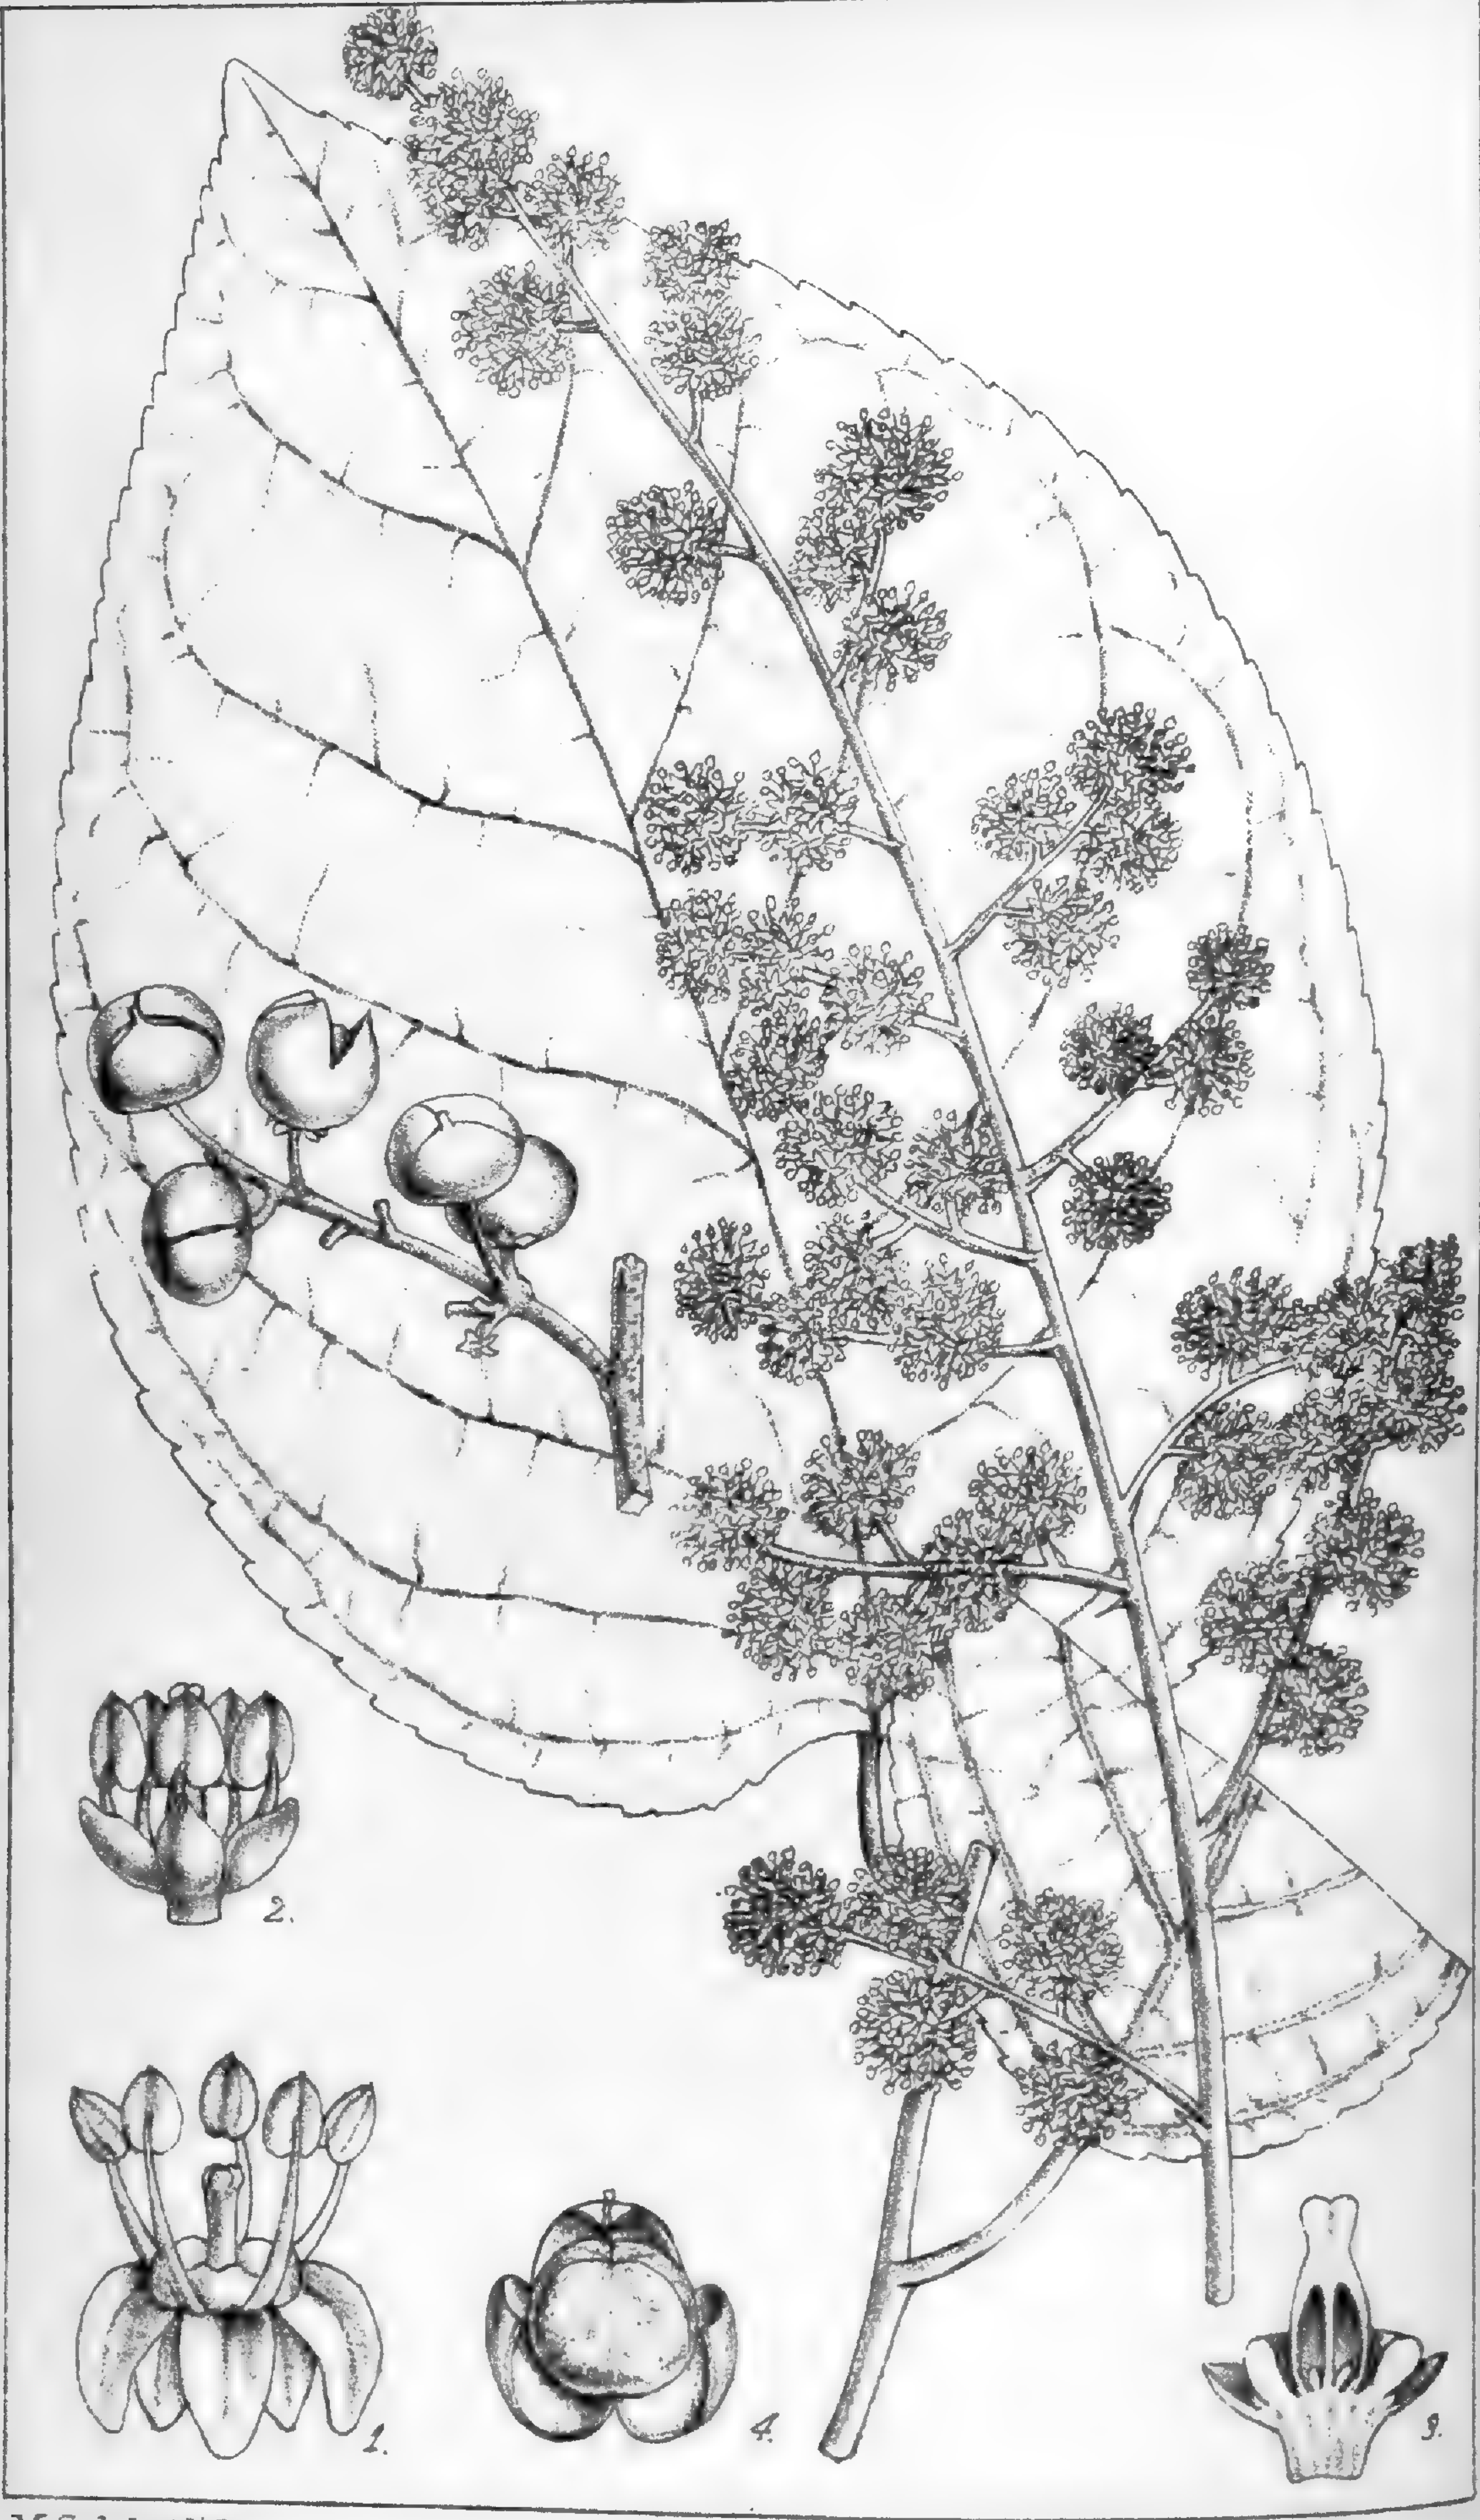

E. africana, *O. Hoffm. in Engler, Bot. Jahrb.* x. (1889), 273, tab. ix. A. var. *radiata*, *Oliv.*; foliis ovatis utrinque 3-6-dentatis, dentibus oblique deltoideis acutis, capitulis radiatis, ligulis oblongis involucre 2-plo longioribus.

HAB. Trop. Africa, Angola, *Dr. Welwitsch* (No. 3,999).

Herba (v. frutex) ramosa glabra, ramulis teretibus. *Folia* longiuscule petiolata sæpius subopposita carnosula acuta basi nonnunquam rotundata v. truncata, in ramulis floriferis $\frac{1}{2}$ - $\frac{3}{4}$ poll. longa, 4-6 lin. lata. *Involucrum* bracteis interioribus anguste linearibus acutis, margine anguste scariosis apicem versus fimbriatis, costa colorata gummifera percursis. *Receptaculum* nudum. *Flores* radii ligulati, ♀, ligula 5-6 lin. longa. *Antheræ* basi inappendiculatæ, apice connectivo lanceolato productæ; filamentis prope apicem leviter glandulosim incrassatis. *Stylus* ramis longiusculis anguste linearibus crassiusculis obtusiusculis papillois. *Achænia* setulosa 3-5-costata, costis resiniferis interruptis obtusis.

Of this plant we have a specimen, communicated by the Polytechnic Museum of Lisbon, collected by the late *Dr. Welwitsch*, who had given it in manuscript the name *Adenogonum decumbens*. It corresponds so nearly with the figure cited above, and with a small specimen, kindly communicated to the Kew Herbarium by *Dr. Engler*, collected by *Marloth* in Herero Land, that I feel bound to refer it to the same species, notwithstanding the presence of conspicuous ray-florets. Of the colour of the florets I have no note, but should judge them to be homochromous.—*D. OLIVER*.

Fig. 1. Ray-floret. 2. Disk-floret. 3. Seta of pappus. 4. Anthers. 5. Achene. All enlarged.

M. S. del et lith.

Celastrus latifolius, Hemsl.

PLATE 2206.

CELASTRUS LATIFOLIUS, *Hemsl.*

CELASTRACEÆ.

C. latifolius, *Hemsl. in Journ. Linn. Soc.* xxiii. 123; frutex ramulis brunneis purpurascensve subteretibus v. ultimis ob lineas decurrentes elevatas subangulatis sæpe crebre lenticellatis, foliis late ellipticis obtuse cuspidatis crenato-serratis glabris v. subtus in costa nervis venulisque parce pilosulis, paniculis multifloris terminalibus ramulis primariis subpatentibus, floribus breviter pedicellatis v. subsessilibus ♂ et ♀, calycis lobis ovatis glabris basi carnosulis, petalis oblongo-ellipticis minutissime erosis recurvis calyce 3-plo longioribus, fl. ♂ filamentis corolla æquilongis anthera 2-plo longioribus, anthera majuscula ovato-elliptica obtusa, fl. ♀ filamentis anthera haud longioribus, ovario obtuse 3-gono glabro disco inserto, stylo ovario æquilongo sulcato, capsula depresso-globosa obscure trigona, valvis tenuiter crustaceis lævibus, seminibus solitariis geminatisve arillatis.

HAB. China, Prov. Hupeh, Ichang, Patung district, and 'Nan-t'o and mountains to northward,'—Dr. HENRY (Nos. 485, 1,774, 2,084, 3,405A, 3,883).

Folia 4–6 poll. longa, 3–5 poll. lata; *petiolus* $\frac{3}{4}$ –1 poll. longus. *Fructus* $\frac{1}{3}$ poll. diam.—D. OLIVER.

Dr. Henry communicates the following:—'*Celastrus latifolius*, Hemsl., is a common shrub about Ichang, being known as *nan-shan-yeh*. The root and also the leaves are used, powdered and mixed with flour, to scatter over growing cabbage, turnips, &c., for the purpose of killing obnoxious insects, grubs, &c. I find from one of the Customs publications that the "bark of a tree, called *nan-shao-kên*" occurs in the drug market of Hankow. This is possibly the root-bark of this shrub.'

Fig. 1. Flower. 2. The same, earlier stage, petals removed. 3. Longitudinal section of ovary and disk. 4. Fruit after dehiscence. *All enlarged.*

M. S. del, et lith.

Anodendron oblongifolium, Hemsl.

PLATE 2207.

ANODENDRON OBLONGIFOLIUM, *Hemsl.*

APOCYNACEÆ. Tribe ECHITIDÆÆ.

A. oblongifolium, *Hemsl. in Ann. Bot.* v. 505; frutex alte scandens, foliis oblongis breviter obtuse acuminatis basi rotundatis glabris nervis lateralibus utrinque 8-10, paniculis multifloris pedunculatis terminalibus et in axillis foliorum superiorum parce puberulis, bracteis parvis ovatis, floribus breviter pedicellatis, calycis tubo corollæ brevioris, segmentis ovato-oblongis obtusis, corollæ lobis oblique oblongis obtusis, antheris infra medium tubi insertis apiculatis loculis basi breviter productis, folliculis apicem versus angustatis obtusis longitudinaliter lineatis, coma seminis stipitata.

HAB. Solomon Islands; Fauro Island, *Guppy* (No. 189); San Christoval, *Comins* (No. 40).

Folia $4\frac{1}{2}$ -6 poll. longa, $1\frac{1}{2}$ -2 poll. lata; petiolus 5-6 lin. longus. *Paniculæ* foliis breviores pedunculo 1- $1\frac{1}{2}$ poll. longo. *Flores* $\frac{1}{4}$ - $\frac{1}{3}$ poll. diam., flavescentes.

Both Dr. Guppy (whose specimen was in fruit only, and not determinable with certainty) and the Rev. Mr. Comins note that the tenacious bast of this climber is used by the natives for fishing lines and nets.

Nearly allied to *A. paniculatum*, A. DC., which has a more diffuse inflorescence, its branches and pedicels more slender and longer.—
D. OLIVER.

Fig. 1. Bud, attached, showing æstivation. 2. Flower, expanded. 3. Base of corolla-tube, laid open. 4. Seed. *Excepting No. 4, all enlarged.*

Pedicularis craniolepha, Maxim.
A. var. *typica*: B. var. *longicornuta*.

PLATE 2208.

PEDICULARIS CRANOLOPHA, Maxim.

SCROPHULARINEÆ. Tribe EUPHRASIEÆ.

P. (§ *Siphonanthæ longifloræ*) *cranolopha*, Maxim., *Mel. Biol.*, x. 85 (1877) et xii. 795, t. 1, f. 10 (1888); Prain, *Ann. Roy. Bot. Garden, Calcutta*, iii. 67 (1890); humilis pilosa, foliis lineari-oblongis radicalibus longe petiolatis segmentis lanceolatis serratis, calyce ovato 3-dentato segmento summo lanceolato lateralibus ovato-lanceolatis serratis, corolla lutea, tubo calyce 4-plo longiore, galea cristata, rostro sigmoideo apice emarginato, labii lobo medio emarginato lateralibus fere duplo minore, filamentis omnibus hirsutis.

VAR. *typica*; galeæ crista ad rostri originem usque extensa ibique truncata. *P. cranolopha*, Maxim.

HAB. China; prov. Kansu, Przewalski!

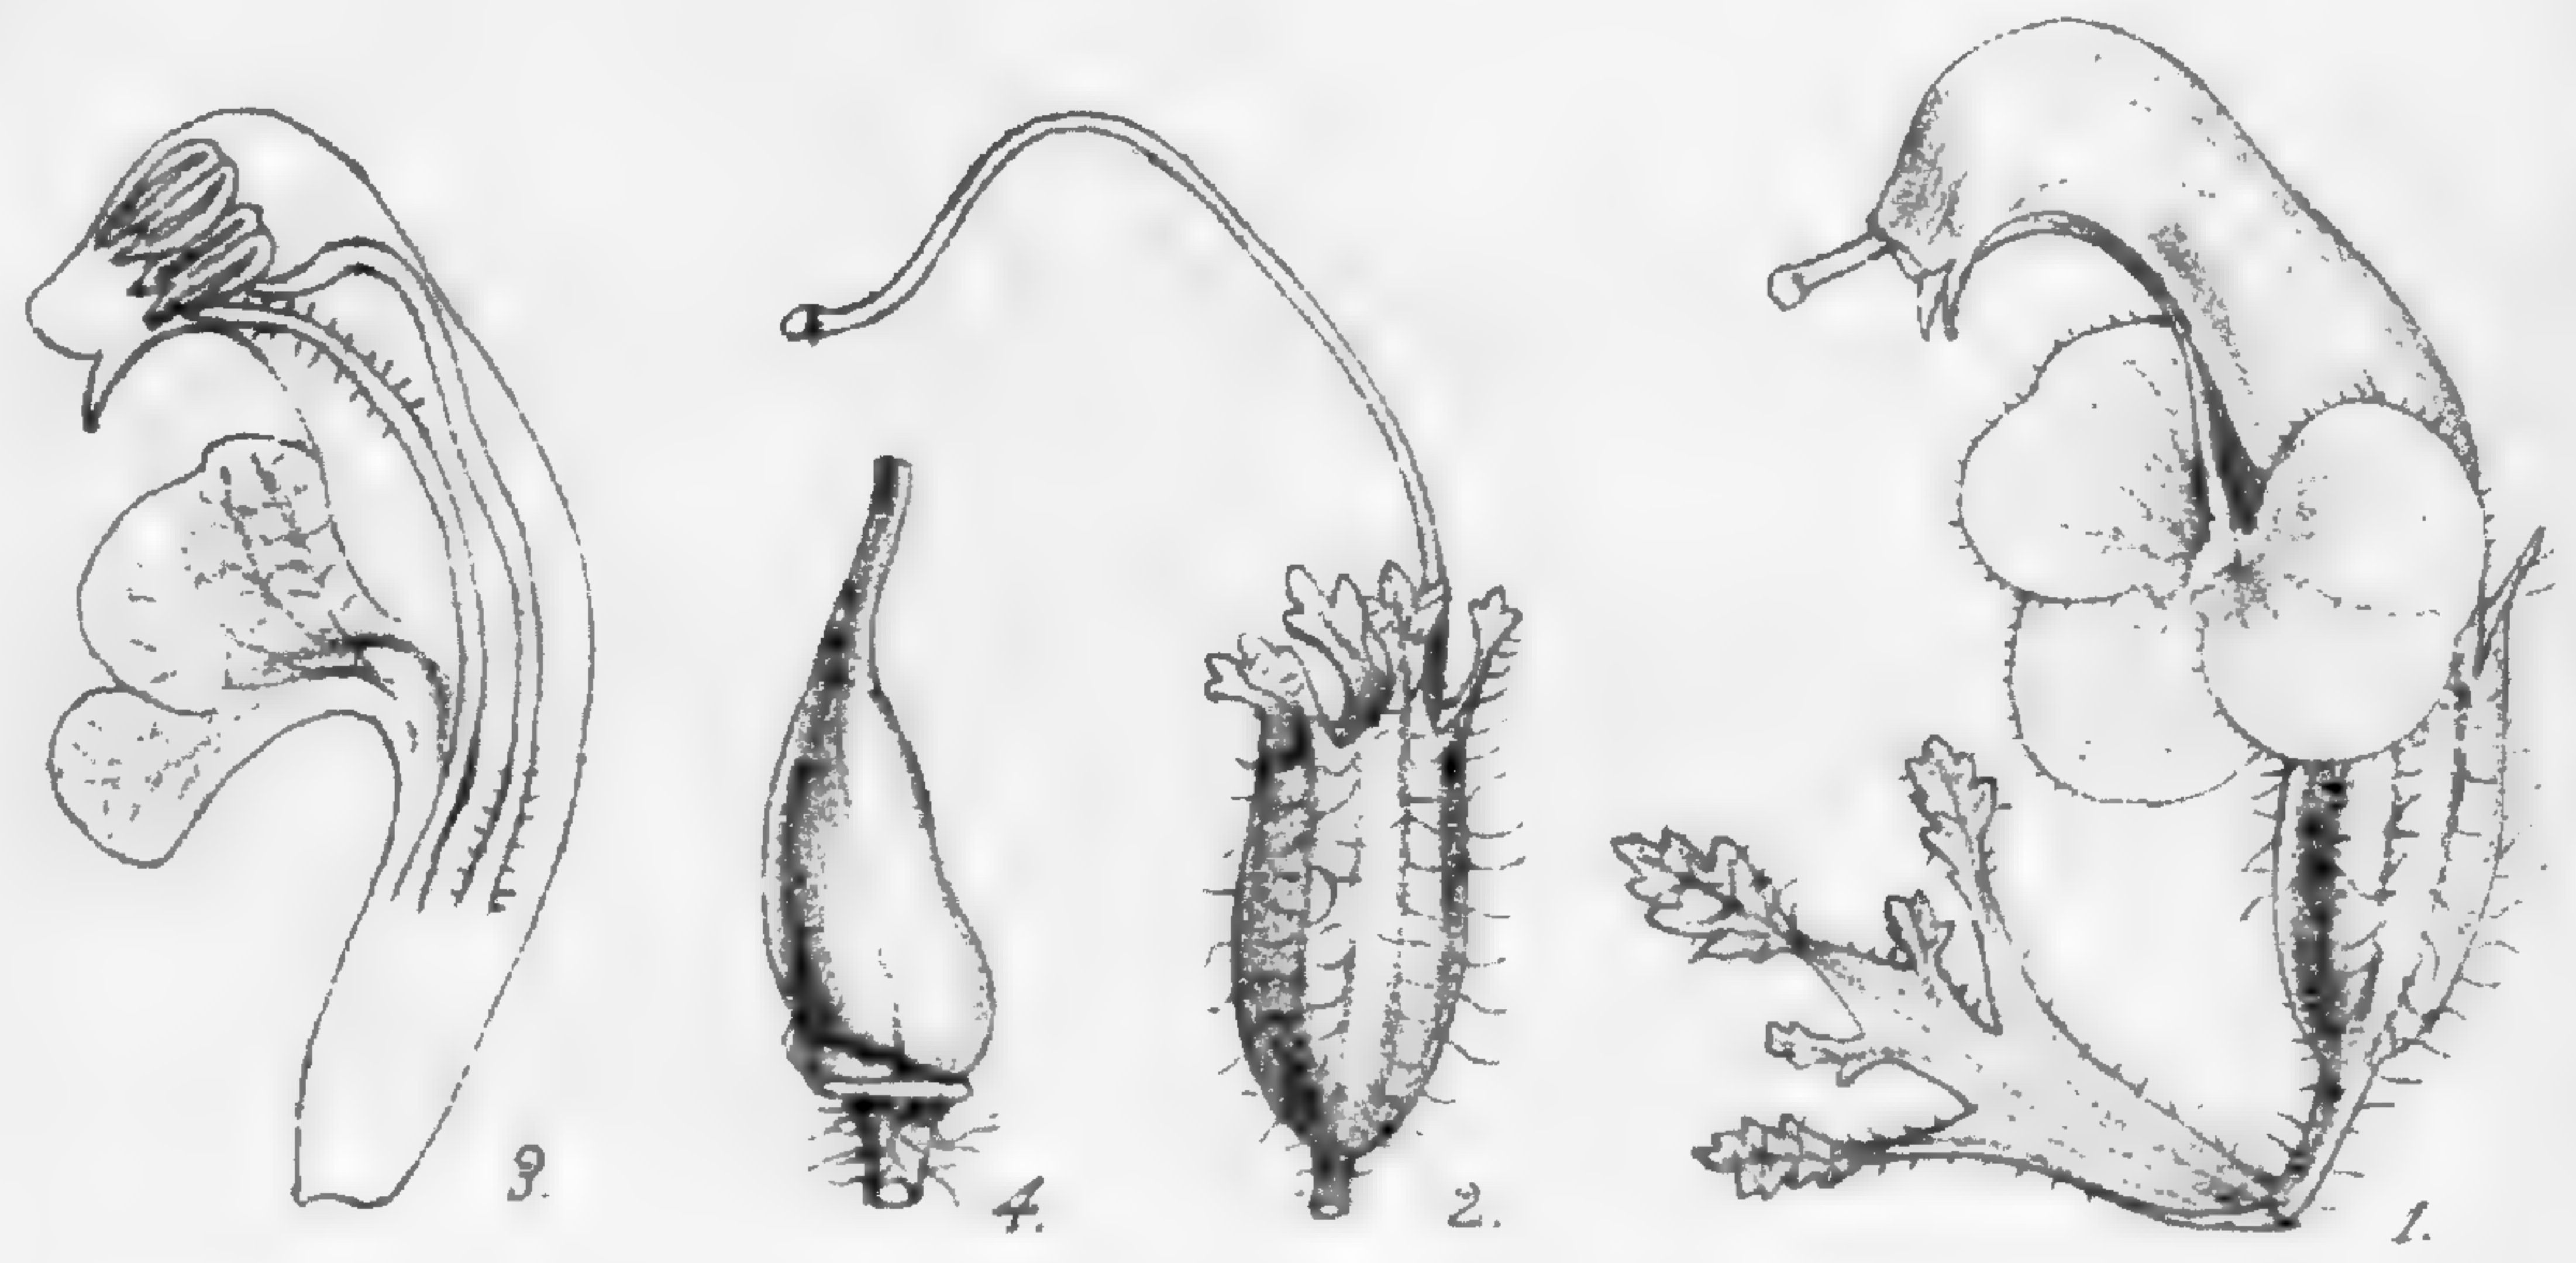

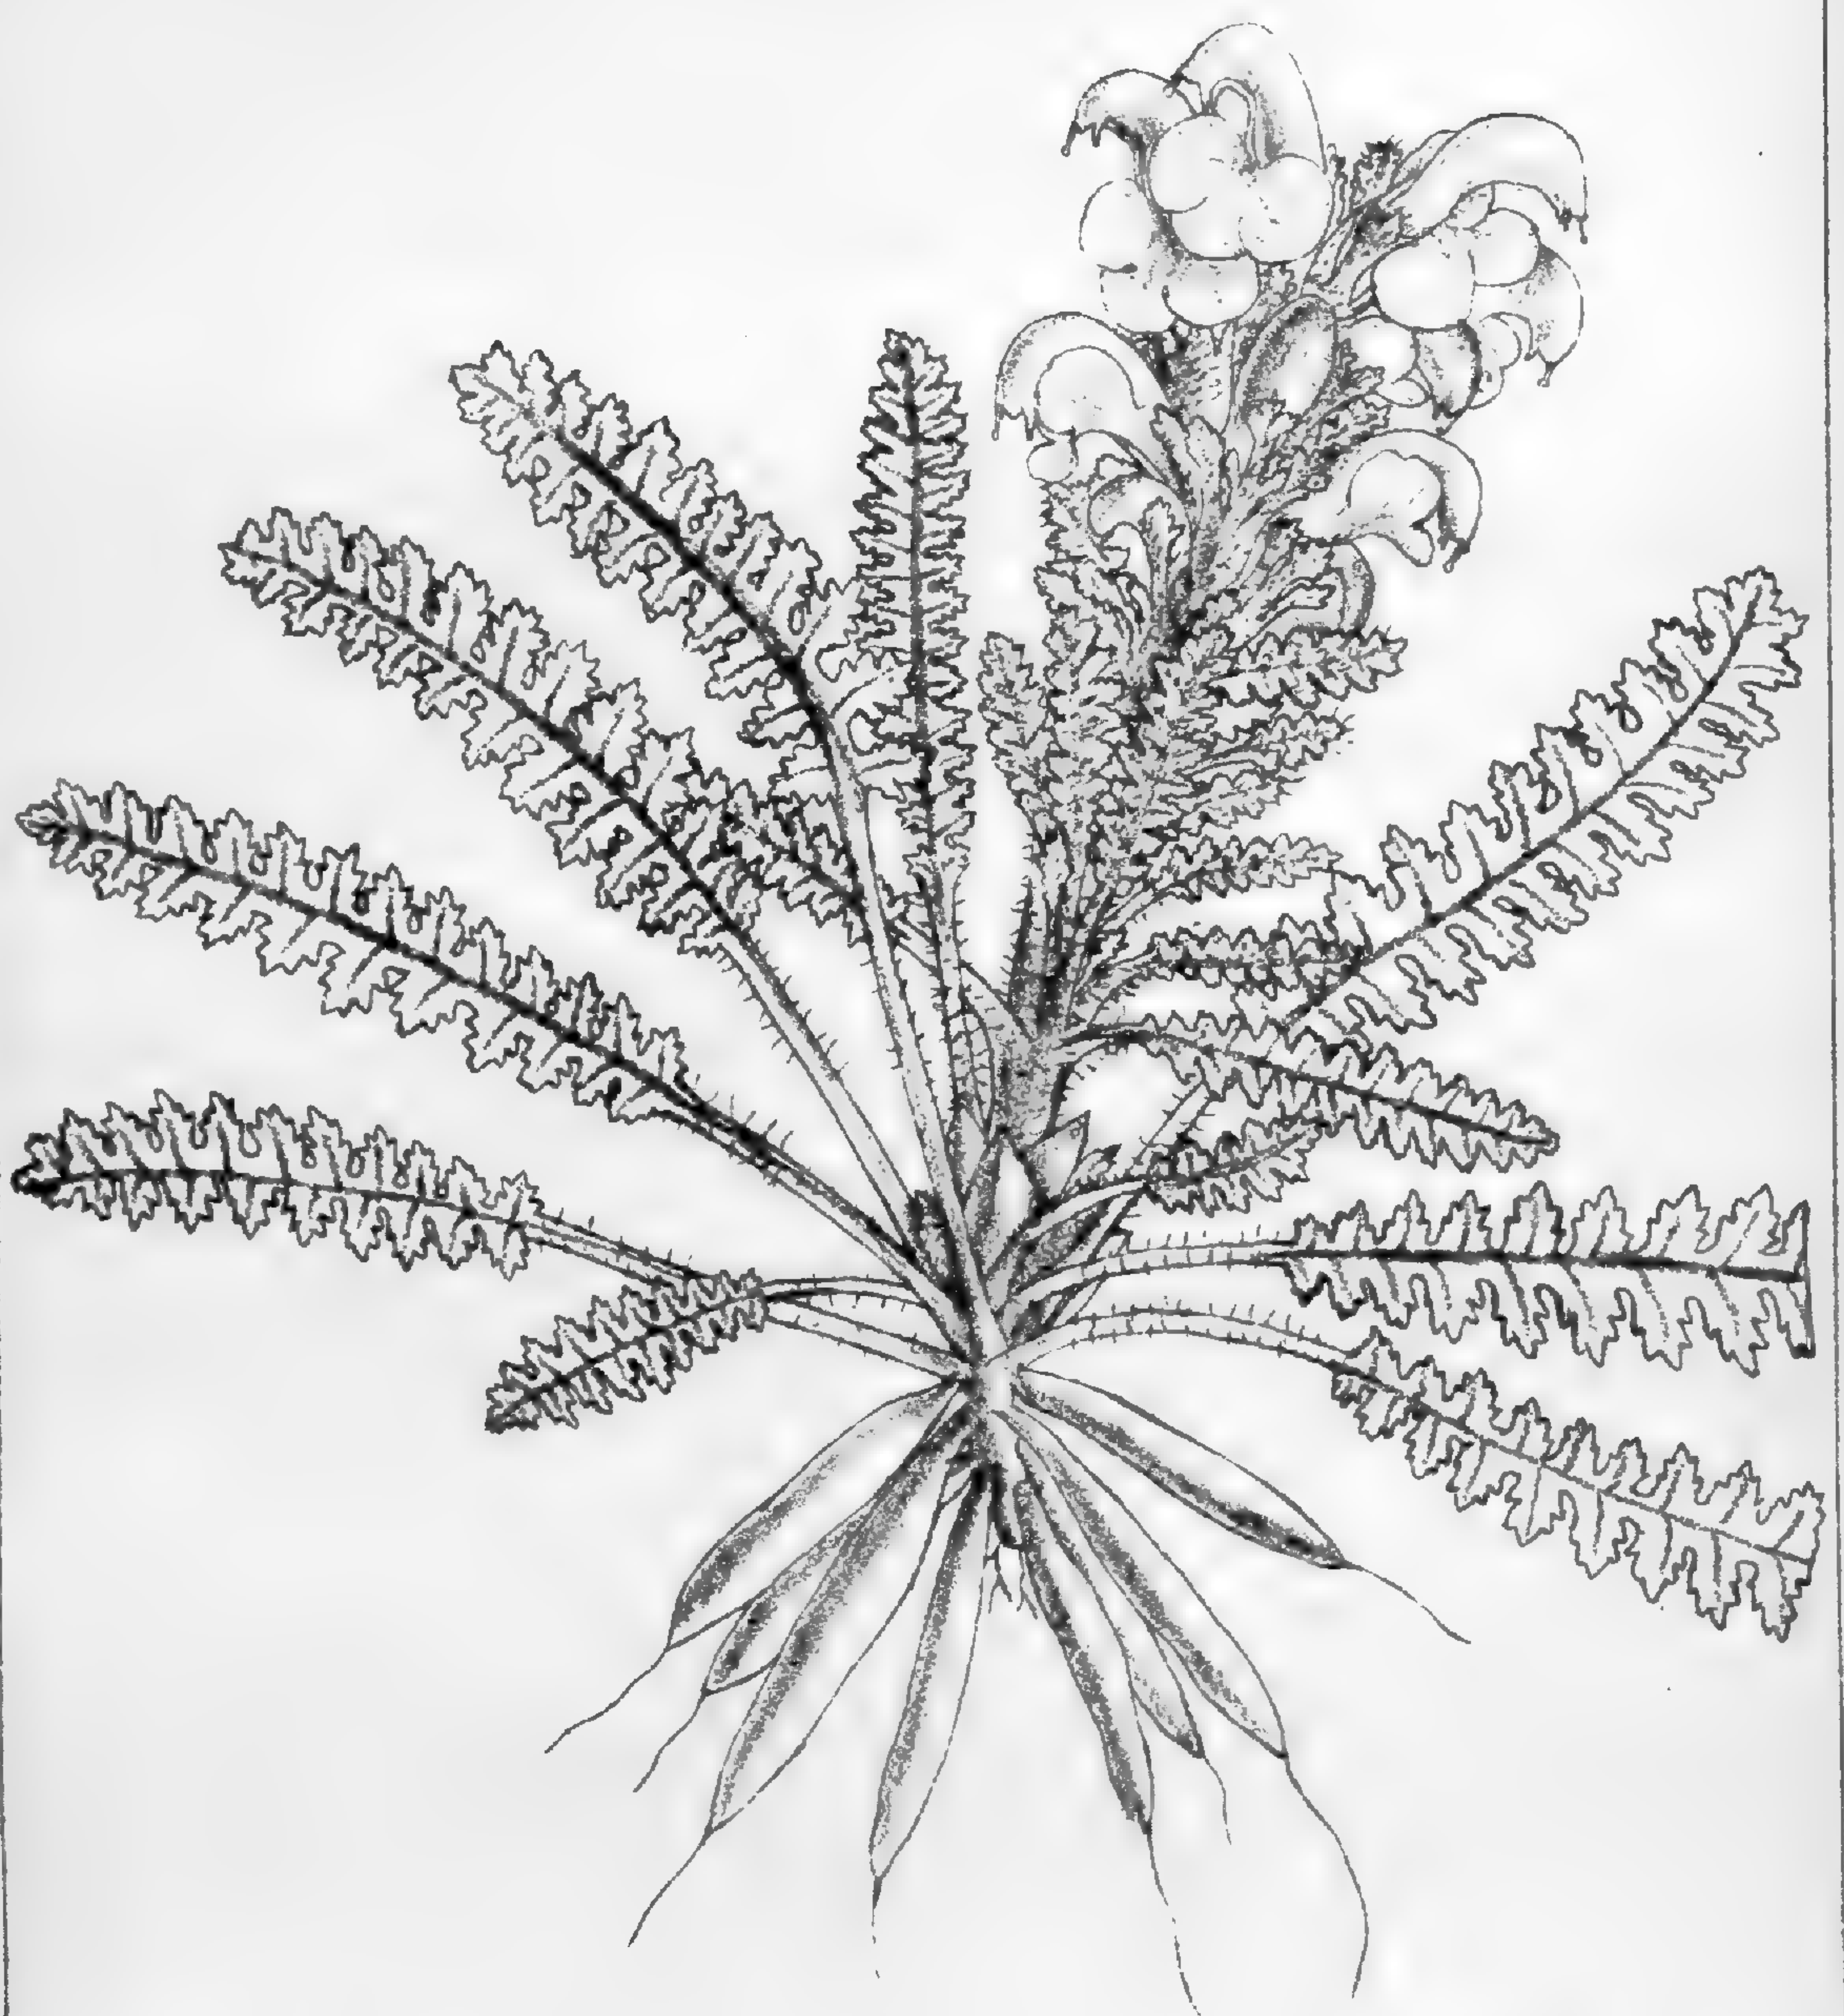

VAR. *longicornuta* (var. nov.); galeæ crista ad rostri originem usque extensa, exinde in cornu rostrum subæquans producta. *P. birostris*, Bur. et Franch. in *Journ. Bot.* v. (1891) 107.

HAB. China; prov. Szechuen, Pratt (No. 167).

This plant of Mr. Pratt's collection, though it has to be referred to an already described species, is the most interesting *Pedicularis* he has found, and is, owing to its curious crest, one of the most interesting forms in this interesting genus. *Pedicularis cranolopha* is not the only species with a crested galea; the condition occurs in *P. torta*, Maxim., *P. oxycarpa*, Frauchet, *P. cristata*, Maxim., *P. leptorhiza*, Ruprecht, and *P. Regeliana*, Prain. But in none of them does the crest become, as here, prolonged into a free process 4-5 mm. long, almost the length of the true beak. And yet, save for this solitary—though certainly striking—character, there is nothing to separate Mr. Pratt's Szechuen plant specifically from General Przewalski's Kansu one. Mr. Pratt's specimens are more robust than those sent to Calcutta by M. Maximowicz, and they show distinctly—what M. Maximowicz and myself had failed to detect in the type—that the margin of the lower lip in this species is ciliate.

The area of distribution of the species is, by Mr. Pratt's gathering, somewhat extended.—D. PRAIN.

Fig. A1. Calyx (var. *typica*). A2. Corolla-lip, hood, and portion of tube (ditto). B1. Calyx (var. *longicornuta*). B2. Corolla-lip, hood, and portion of tube (ditto). All of natural size.

Pedicularis rhynchodonta, Bur. & Franch.

PLATE 2209.

PEDICULARIS RHYNCHODONTA, *Bur. et Franch.*

SCROPHULARINEÆ. Tribe EUPHRASIEÆ.

P. (§ *Rhynchodontæ*: series nov. ante *Comosas* ponenda, humiles, hirsutæ, foliis pinnatisectis, spica densa centrifuga, calyce campanulato dentibus summo excepto serratis) *rhynchodonta*, *Bur. et Franch. in Journ. Bot.* v. (1891) 108; nana, hirsuta, radice valida e fibris pluribus fusiformibus fasciculata, caule digitali basi squamis ovatis obtusis suffulto; foliis petiolatis anguste lanceolatis plerisque radicalibus, caulinis minoribus sparsis, omnibus pinnatisectis 15–20-jugis, segmentis subimbricatis ovato-lanceolatis serrato-dentatis, spica densa multiflora centrifuga, bracteis membranaceis laciniatim 3-partitis, calyce breve pedicellato campanulato, antice vix fisso, 5-dentato, segmento summo lanceolato integro lateralibus oblongis serratis brevioribus anticisque lanceolatis serratis æquilongis, corollæ rubræ tubo adunco calyce vix dimidio longiore labio galea æquilongis latissimo sessili margine ciliolato, lobo medio rotundato lateralibus flabellatim venulosis vix dimidio minore, galea arcuata tubo subcontinua eique æquilata in rostrum latum breve apice undulato-truncatum angulo inferiori utrinque longe 1-dentatum abeunte, staminibus medio tubo insertis filamentis anticis triente summo hirsutis, posticis prope insertionem tantum parce barbatis, ovario ovato-lanceolato, disco antice tumente, stigmate exserto.

HAB. China; prov. Szechuen, *Pratt* (No. 735). *Caules* 6–8 cm. alti, *radicibus* 3–4 cm. longis his 0.5 cm. crassis. *Folia* petiolis radicalibus 3 cm., laminis 4 cm. longis, 1.25–1.5 cm. latis, segmentis 4–7 mm. longis 3 mm. latis, pedicellis 0.5 mm. *Flores* calyce 12 mm. longo, 5 mm. lato, corollæ tubo 16 mm. longo, galea 12 mm. longa, rostro 2 mm. longo latoque, labio 12 mm. longo, 16 mm. lato.

The corolla and bracts bring this very close to *P. apodochila*, Maxim., and *P. rubens*, Steph., but it differs so remarkably in habit and foliage (in which respects it simulates the *Hirsutæ* and the *Flammææ* among *Anodontæ*) from all the *Bidentatæ* hitherto reported, that it is necessary to recognise it as the type of a new group (*Rhynchodontæ*) to be inserted between *Elatæ* and the *Comosæ*.

Besides differing so markedly in general appearance from both *P. apodochila* and *P. rubens*, this differs from *P. apodochila* in having the calyx hardly cleft, the lip rather smaller (not longer than the galea), the corolla-beak rather longer and somewhat differently shaped. The beak is almost exactly that of *P. rubens*, but it differs (as *P. apodochila* does) from that species in having a sessile (not stipitate) lip, and in having serrate (not entire) calyx-teeth.—D. PRAIN.

Fig. 1. Flower, with bract. 2. Calyx, with style. 3. Half of corolla, showing staminal insertion. 4. Ovary, with disc. 1, 2 and 3 are twice, 4 is four times, natural size.

Strychnos Ignatii, Berg.

PLATE 2212.

STRYCHNOS IGNATII, *Bergius*.

LOGANIACEÆ.

S. Ignatii, *Bergius*, *Mat. Med.* i. 146 (1778); scandens, glabra, foliis ellipticis v. ovato-ellipticis breviter acuminatis cuspidatisve conspicue trinerviis, floribus brevissime pedicellatis subsessilibusve cymosis in paniculis brevibus axillaribus folio multo brevioribus dispositis, paniculis breviter pedunculatis, calycis segmentis late ovatis v. ovato-rotundatis, corolla calyce 6-10-plo longiore extus tomentoso-puberula intus glabra v. parce pilosula, lobis limbi ovatis crassiusculis tubo 3-4-plo brevioribus, antheris fauce corollæ tubi insertis sessilibus v. subsessilibus oblongo-ellipticis apice mucronatis, ovario glabro in stylum elongatum attenuatum, bacca globosa v. ellipsoidea * c. 4 poll. diam., polysperma.—*Phil. Trans* (1699) xxi. t. i. figs. 4-6.

HAB. Philippines: Mindanao and Samar, *R. Boxall*.

Folia $3\frac{1}{2}$ -6 poll. longa, $2-3\frac{1}{2}$ poll. lata; *petiolus* $\frac{1}{2}$ poll. longus. *Paniculæ* cum pedunculo $1-1\frac{1}{2}$ poll. longæ. *Flores* $\frac{1}{2}-\frac{2}{3}$ poll. longi, limbo corollæ $\frac{1}{4}-\frac{1}{3}$ poll. diam. *Bracteæ* ovatæ acutiusculæ concavæ, majores 1 lin. longæ. *Stylus* filiformis ovario multoties longior. *Pericarpium* sublæve olivaceum crustaceum. *Semina* in pulpa nidulantia ellipsoidea obtuse angulata $1\frac{1}{3}-1\frac{1}{2}$ poll. longa, 8-10 lin. lata, pilis brevibus nitentibus appressis sericea.

Mr. Boxall, the collector of the specimens, both in flower and fruit (the latter preserved in spirits), here figured, says that there is another species of *Strychnos*, known as St. Ignatius's Bean, which is much more plentiful than this plant, and that it is the seeds of this other species which are exported as St. Ignatius's beans. The seeds of the plant here figured are, however, used in medicine in the Philippines under the same name.

Why, then, refer this plant to *Strychnos Ignatii*, of Bergius, rather than to the commoner species affording the exported seeds?

S. Ignatii was based by Bergius, in his 'Materia Medica,' i. 146 (1778), upon the description contained in a letter from Father Camelli, addressed to John Ray and James Petiver, an abstract of

* Mr. Boxall says the form of the fruit is variable, two never precisely alike.

which is given in Phil. Trans. xxi. (1699), No. 250 (and abridged edition, vol. iv. 356). A figure of the leaves, fruit, and seed is given in the unabridged edition, the leaves and fruit being reproduced in Bentley and Trimen's 'Medicinal Plants,' iii. t. 179. In the figure cited of the leaves, the lateral nerves are basal in their origin, that is they are tri- or quinque-nerved, not tripli- or quintupli-nerved (that is, diverging from the midrib above the base). And it is upon this foliar character we are obliged to depend, for the flowers are not intelligibly described,* and there is reason to think the fruits of the two species do not materially differ.

In Camelli's figure of the leaves, the lateral nerves all originate at the base of the lamina. Now there are only two species likely to afford these seeds in the southern islands of the Philippine group in the Kew Herbarium, viz., one with the lateral nerves basal (here figured), and *S. multiflora*, Benth., figured in the following plate, in which the lateral nerves next to the midrib are coalescent with it to about $\frac{1}{3}$ — $\frac{1}{2}$ inch above the base of the lamina. It is on this ground, therefore, it would seem to be more prudent to regard this plant as probably identical with Camelli's, named by Bergius; while we have, at any rate, a sure name for the other species, viz. that given by Mr. Bentham, *S. multiflora*, one of whose type specimens we figure (Pl. 2213).

Owing to the confusion introduced by Linnæus fil., Suppl. Plant. (1781) 149, who based his description of the flowers of *Ignatia amara* on a *Posoqueria*, as pointed out by Mr. Bentham (Journ. Linn. Soc. i. 108), and to discrepancies in the description given by other authors, I have not ventured to cite any synonymy in the usual form. But, taking the principal postlinnean references to St. Ignatius's beans in the order of date, they stand thus: Bergius's 'Materia Medica,' in which the plant was first named, appeared, as cited above, in 1778. *Ignatiana philippinica*, Loureiro, Fl. Cochinch. (1790), i. 126, continues the middle of the 'Supplementum,' under slight modification of the generic and complete change of the specific name. He adds *S. Ignatii*, Berg., as a synonym.

Ignatia amara, Linn. f., is adopted by Blanco in his Flora Filip. (1837), 82, the description of the flowers being taken from Linn. fil.; but in the second edition of this work (ed. 1845, 61), having in the meantime received flowers independently from Bohol, he reverts to the genus *Strychnos*, naming the plant *S. philippensis*, and modifying the description of the flowers in accordance with the new material. The same name is retained in the folio edition of Blanco, by Naves (1877), i. 116, with an additional note on the seeds in the 'Appendix' (1880), 136.

Bentley and Trimen, 'Medicinal Plants,' 1880, iii. 179, adopt Bergius's name, and cite as synonyms Loureiro's name and that given by Blanco in

* ' . . . florem Balaustiae similem.'

his second edition. Their description, however, of the flowers, taken from Blanco and Loureiro, is a compromise between that given by Linn. fil. of a *Posoqueria* and the corrected description of Blanco (ed. ii.). They reproduce the leaves, fruit, and seed from Phil. Trans., xxi. (1699), t. i. figs. 4-6.

Professor Flückiger and A. Meyer, in the 'Pharmaceutical Journal,' 1881, vol. xii. (July 2), give a careful account of the fruit of *S. Ignatii*, with full detail of the histology of the seed and curious hairs of the testa. This agrees with our plant, so far as I can see. They also add copious references to the literature of the subject.

Finally, adopting Bergius's name, Vidal, in his Revision de Plant. Vasc. Filip. (1886), 450, quotes Blanco's name from his second edition, and the names given by Linn. f. and Loureiro as synonyms, but figures, in two plates, a short-flowered *Strychnos*, the corolla bearded in the throat, and altogether only twice as long as the calyx, in which characters it agrees with *S. multiflora*, Benth., although he figures the leaves as tri-nerved, not tripli-nerved as in that species. As his description, however, definitely states the lateral nerves are given off 5-10 mm. above the base, I can hardly hesitate to regard his figure as intended to represent Mr. Bentham's plant figured in our next plate.

Messrs. C. Ford and W. E. Crow, in the 'China Review,'* in their 'Notes on Chinese Materia Medica,' accept Vidal's conclusions referred to above. From seeds forwarded to the Royal Gardens, Kew, by Alexander Gollan, Esq., H.M. Consul at Manila, the plant is now in cultivation, though it has not yet reached the flowering stage.

Strychnos multiflora, Benth.

PLATE 2213.

STRYCHNOS MULTIFLORA, *Benth.*

LOGANIACEÆ.

S. multiflora, *Benth. in Journ. Linn. Soc. i. (1857) 102*; glabra, foliis late ellipticis v. ovato-ellipticis breviter et obtusiuscule acuminatis triplinerviis, floribus 5-meris cymosis in paniculis multifloris terminalibus et in axillis foliorum superiorum dispositis, pedicellis ternis calyce subæquilongis, corollæ rotatæ limbo tubo æquilongo, tubo calyce temp. florifero 2-plo longiore ore villosa, limbi lobis ovato-lanceolatis acutiusculis crassiusculis intus (sicco) cano-puberulis, antheris exsertis, ovario ovoideo piloso stylo elongato 3-4-plo brevior.

HAB. Philippines, Luzon, *Cuming* (Nos. 641, 695, 1,059, 1,482). Luzon, District of Morong, *Vidal* (No. 1,615).

Folia 3-7 poll. longa, $1\frac{3}{4}$ - $3\frac{3}{4}$ poll. lata; *petiolus* $\frac{1}{4}$ - $\frac{2}{3}$ poll. longus. *Flores* $\frac{1}{4}$ - $\frac{1}{3}$ poll. diam. *Calyx* segmentis ovato-rotundatis ciliatis.

The leaves are 3- or 5-nerved, but the inner lateral nerves coalesce with the midrib to $\frac{1}{3}$ - $\frac{1}{2}$ in. above the base.

The only fruits which I have seen are immature, not exceeding an inch or two in diameter. When ripe it is probably globose or ellipsoidal and $3\frac{1}{2}$ to 5 ins. in diameter. Our specimens are destitute of cirrhi.

We have thought it desirable to give an authentic figure of this plant from type specimens, in view of the ambiguity attending the plate, given by Vidal, of what he considered to be *S. Ignatii*, Bergius. See remarks under preceding plate.—D. OLIVER.

Fig. 1. Bud. 2. Corolla, laid open. 3. Pistil. 4. Transverse section of ovary. *All enlarged.*

FRITILLARIA LOPHOPHORA, *Bur. et Franch.*

LILIACEÆ. Tribe TULIPEÆ.

F. lophophora, *Bureau et Franchet in Journ. de Botanique*, 1891, 153; bulbo squamato squamis majusculis erectis oblongo-lanceolatis carnosis tempore florifero laxiusculis, caule 1-2 floro inferne paucisquamato, foliis medium versus caulis plus minus confertis alternis ovali- v. lanceolato-oblongis superioribus acuminatis inferioribus acutiusculis obtusisve, perianthio magno (2-4 poll. diam.) cernuo longiuscule pedunculato, segmentis subpatentibus lanceolatis æquilongis et subæquilatis (v. exterioribus paullo angustioribus) longe acuminatis basi secundum costam utrinque fimbriato-cristatis v. cristis interdum obsolete, staminibus perianthio 2-3-plo brevioribus, filamentis glabris lineari-subulatis, antheris linearibus dorsifixis, ovario glabro stylo apice leviter dilatato 3-lobulato subæquilongis.

HAB. In a collection from West Szechuen and the Tibetan frontier, chiefly made near Tachienlu, alt. 9,000-13,500 feet; *Pratt* (Nos. 261, 568), Szechuen, between Batang and Litang, *M. Bonvalot and Prince Henry of Orleans*; Yun-nan, *M. Delavay*.

Bulbi squamæ $1\frac{1}{4}$ -2 poll. longæ. *Caulis* $\frac{1}{2}$ - $1\frac{1}{2}$ -pedalis. *Folia* majora 4-5 poll. longa, $\frac{3}{4}$ -1 poll. lata (forma minor 2 poll. longa, 4-5 lin. lata). *Perianthii* segmenta $1\frac{3}{4}$ -3 poll. longa.

Intermediate between *Fritillaria*, to which MM. Bureau and Franchet refer it (as the type of a new section of the genus, § *Lophophora*) and *Lilium*. The flowers are described as yellow, often spotted with red.—D. OLIVER.

Fig. 1. Stamens, back and front view. 2. Pistil. *Enlarged.*

M.S. del. et lith.

Coriaria terminalis, Hemsl.

PLATE 2220.

CORIARIA TERMINALIS, *Hemsl.*

CORIARIEÆ.

Coriaria terminalis, *Hemsl.* (*sp. nov.*); herbacea, foliis sæpius rotundatis 7-9-nerviis, racemis elongatis terminalibus.

HAB. In a collection from West Szechuen and the Tibetan frontier, chiefly near Tachienlu, alt. 9,000-13,500 feet, *Pratt* (No. 820). Also from several localities in Sikkim at elevations of 9,000 to 11,000 feet, namely Lachen, Changtum and Samdong, collected by *Sir J. D. Hooker*.

Herba perennis (ut videtur), caulibus erectis 2-3-pedalibus pauciramosis crassiusculis. *Folia* opposita vel subopposita, sessilia vel brevissime petiolata, membranacea, late ovata vel interdum fere orbicularia, vel in ramulis lateralibus oblongo-lanceolata 1-3 poll. longa, abrupte breviterque acuminata, basi cordata et semiamplexicaulia vel rotundata, 5-9-nervia sed sæpissime 7-nervia, subtus præcipue secus nervos asperula. *Flores* polygami in racemos solitarios terminales 5-7 poll. longos dispositi, pedicellis gracilibus puberulis vel asperulis circiter semipollicaribus, demum patentibus. *Sepala* ovata vel lanceolata obtusa vel acuta. *Petala* per anthesin parva quam sepala multo minora, post anthesin accrescentia, incrassata, intus carinata. *Carpella* glabra, carinata, sæpius 2-costata.*

In the 'Flora of British India' this very distinct species is not distinguished from *C. nepalensis*, Wall., though in the Kew Herbarium it is marked *var. sikkimensis* in the handwriting of Sir J. Hooker.

Coriaria nepalensis, Wall., is quite woody, and has three-nerved glabrous leaves, and short, often clustered, lateral racemes. It ranges from North-western India into Central China; and the Japanese *C. japonica*, A. Gray, presents no obvious differences any more than specimens in the Kew Herbarium from the Philippine Islands.—W. B. HEMSLEY.

Fig. 1. Flower and bract. 2. Sepal. 3. Anther, back and front view. 4. Pistil. 5. Longitudinal section of carpel. 6. Persistent corolla enclosing fruit. 7. Fruit carpel. 8. Embryo. *All enlarged.*

* Fruit figured and described from an Indian specimen.

M.S. del. et lith.

Dendrophthora cupressoides, Eichl.

PLATE 2221.

DENDROPHTHORA CUPRESSOIDES, Eichler.

LORANTHACEÆ. Tribe VISCEÆ.

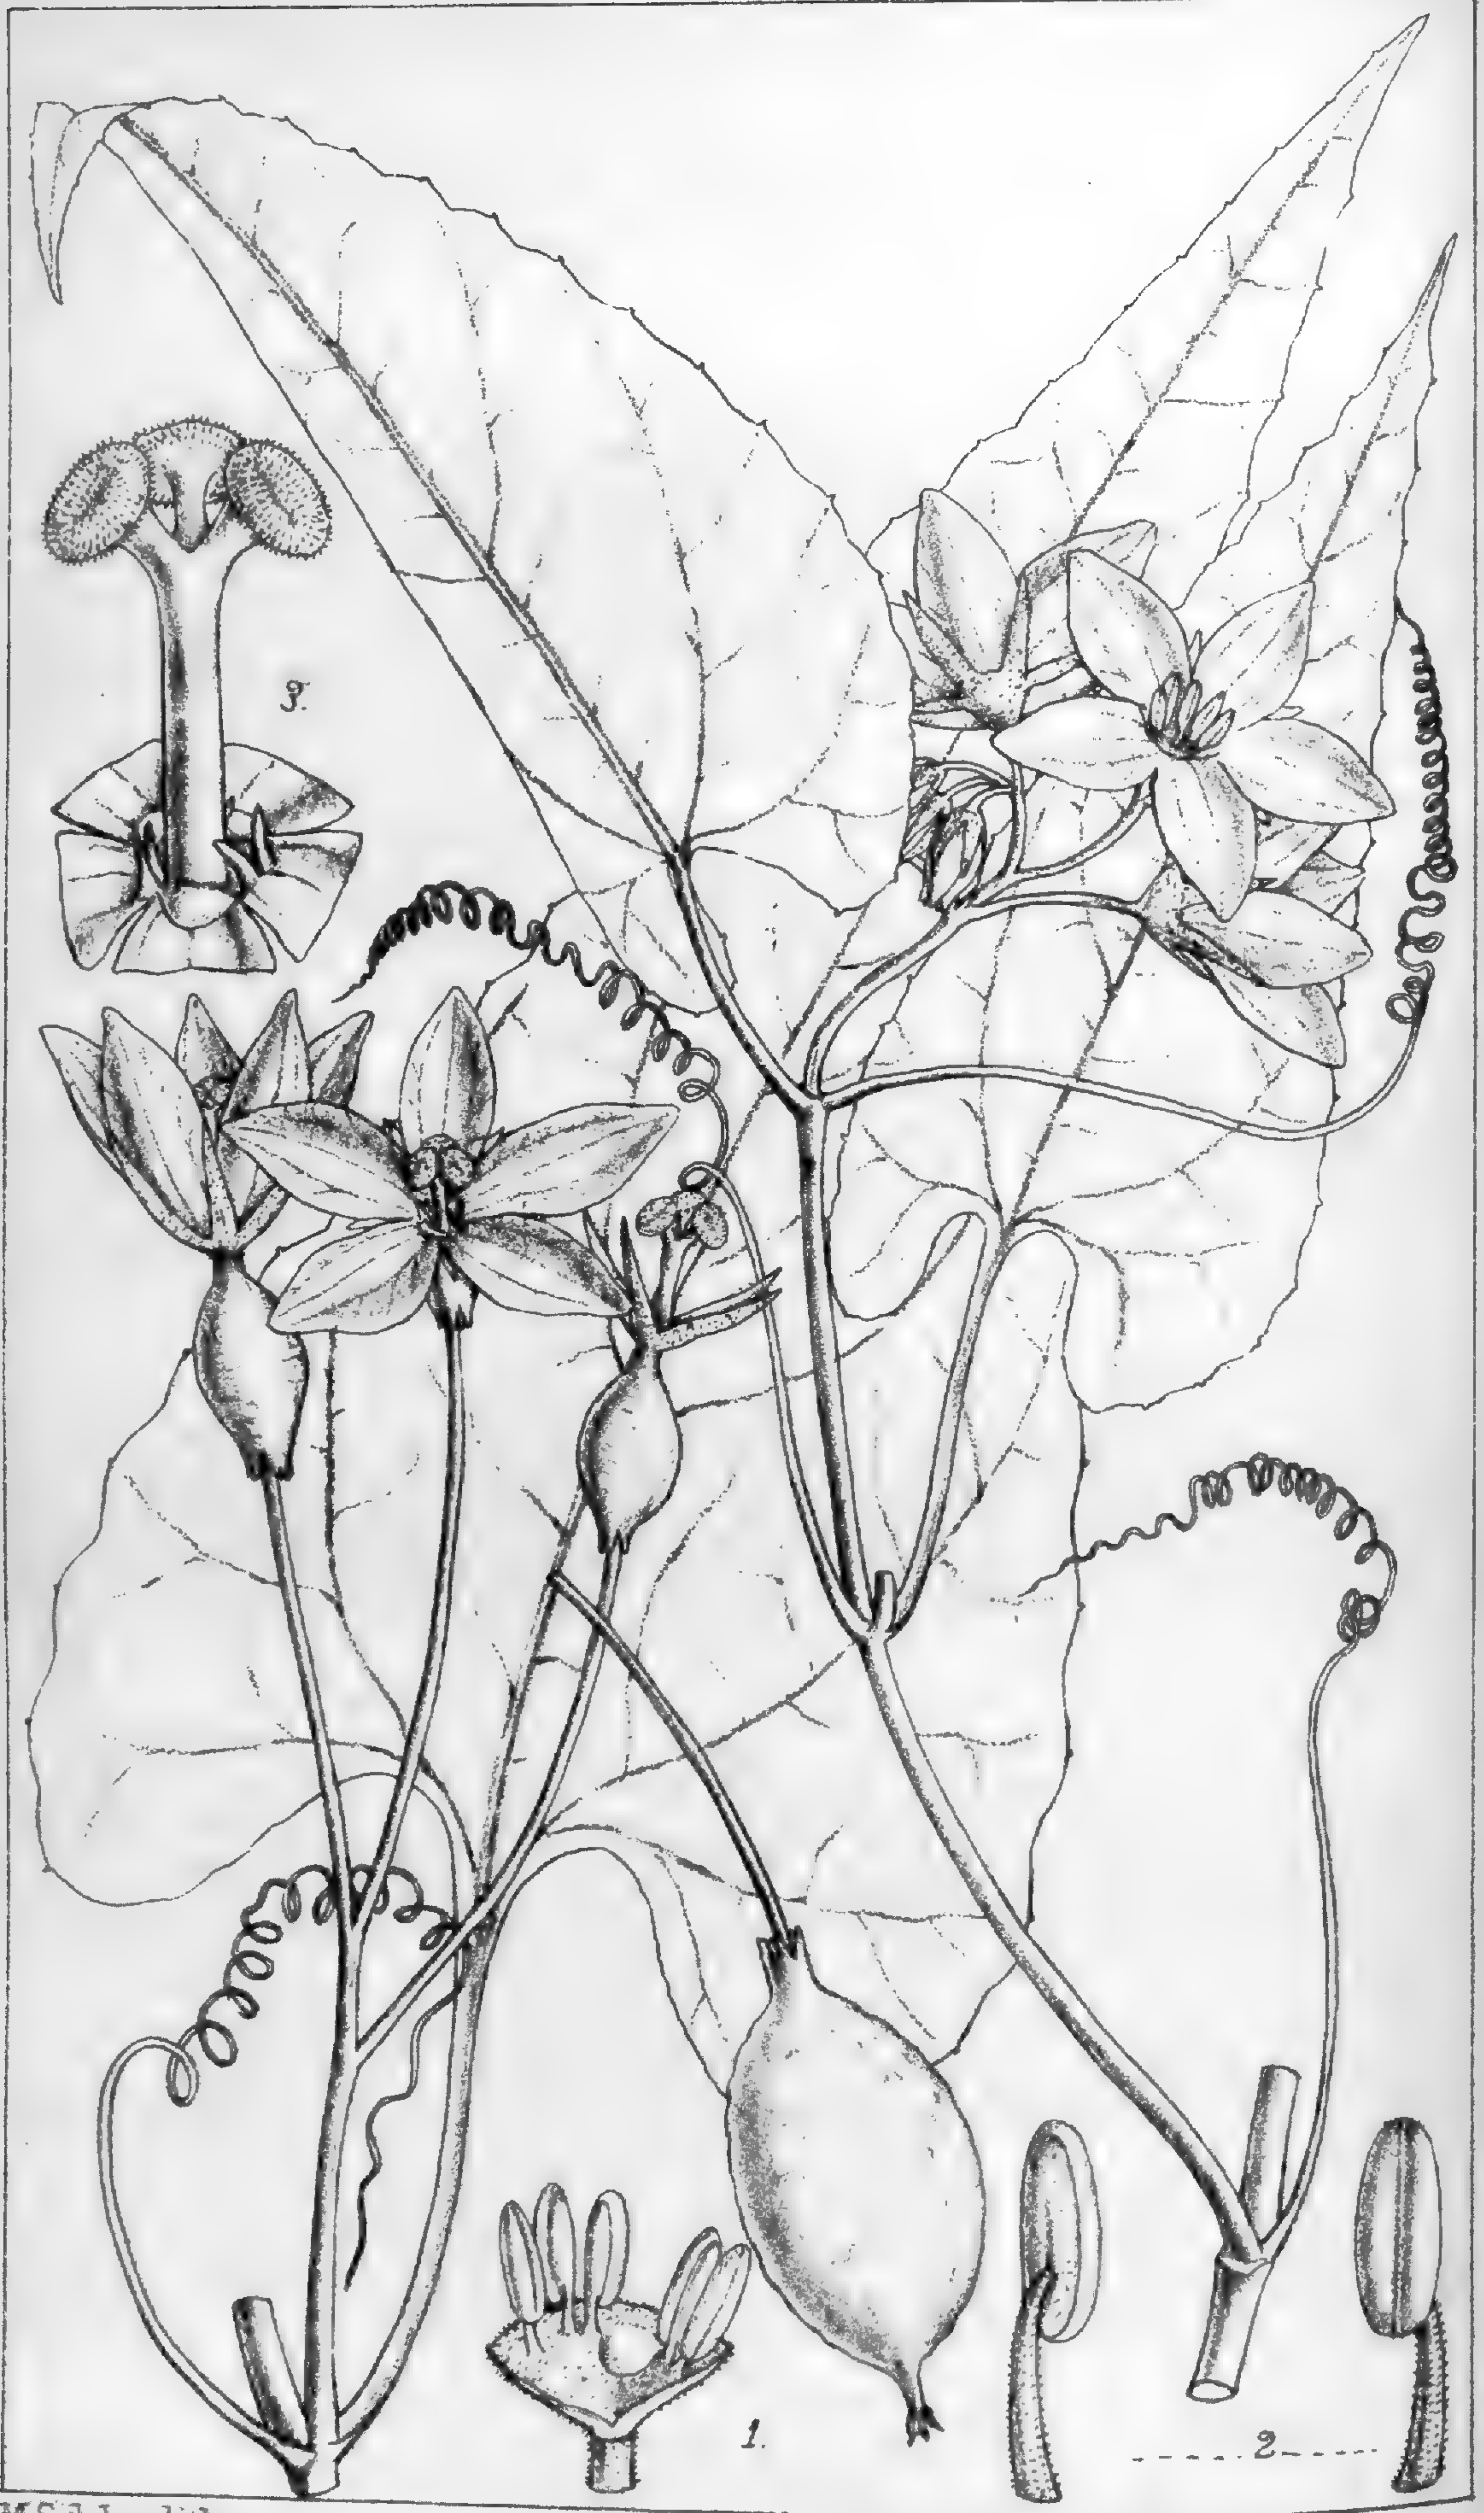

D. cupressoides, Eichl. in Martius, *Fl. Bras. (Loranth.)*, v. pt. ii. 103 (*ad not.*); fruticulosa aphylla fastigiatis ramosissima, ramis teretibus papilloso-scabridis, squamis parvis ovato-deltaideis appressis connatis, spicis floriferis sæpius 2-4-articulatis, articulis brevibus, bifloris, floribus monoicis decussatim oppositis, floribus ♂ paucis, perianthio 3- (v. interdum 4-)fido, segmentis crassis late deltaideo-ovatis, antheris sessilibus lunulatis basi segmentorum insertis rima transversa dehiscentibus, fl. ♀ perianthii limbo 3(-4)-partito segmentis crassis deltaideis. *Arceuthobium cupressoides*, Gris. *Fl. Brit. W. Ind.* 315.

HAB. Jamaica, Macfadyen (at Castleton), Morris, Fawcett.

Internodia caulina inferiora crassitie pennæ gallinacæ, 3-5 lin. longa, superiora c. 2 lin. longa. *Spicæ* articuli $1\frac{1}{4}$ -2 lin. longi.

Dr. Eichler cites (l. c.), as identical, *Phoradendron serpyllifolium*, Gris. Pl. Wright, 192, a Cuban species, but I doubt whether it be the same. I have refrained from any description of the ovule and embryogeny, as this would involve prolonged investigation unfitted for 'Icones Plantarum.' We may hope to find some competent observer willing to take in hand the detailed examination of the excellent specimens, preserved in alcohol, communicated by Messrs. Morris and Fawcett.—D. OLIVER.

Fig. 1. Portion of inflorescence with staminate flowers. 2. Staminate flowers from above. 3. Joint of inflorescence with pistillate flowers. 4. Pistillate flower detached. *All enlarged.*

2. Stamen, back and front view. 3. Staminodes, style and stigmas. *All enlarged.*

M.S. del. et lith.

Thladiantha? Henryi, Hemsli.

PLATE 2223.

THLADIANTHA? HENRYI, Hemsl.

CUCURBITACEÆ. Tribe CUCUMERINÆ.

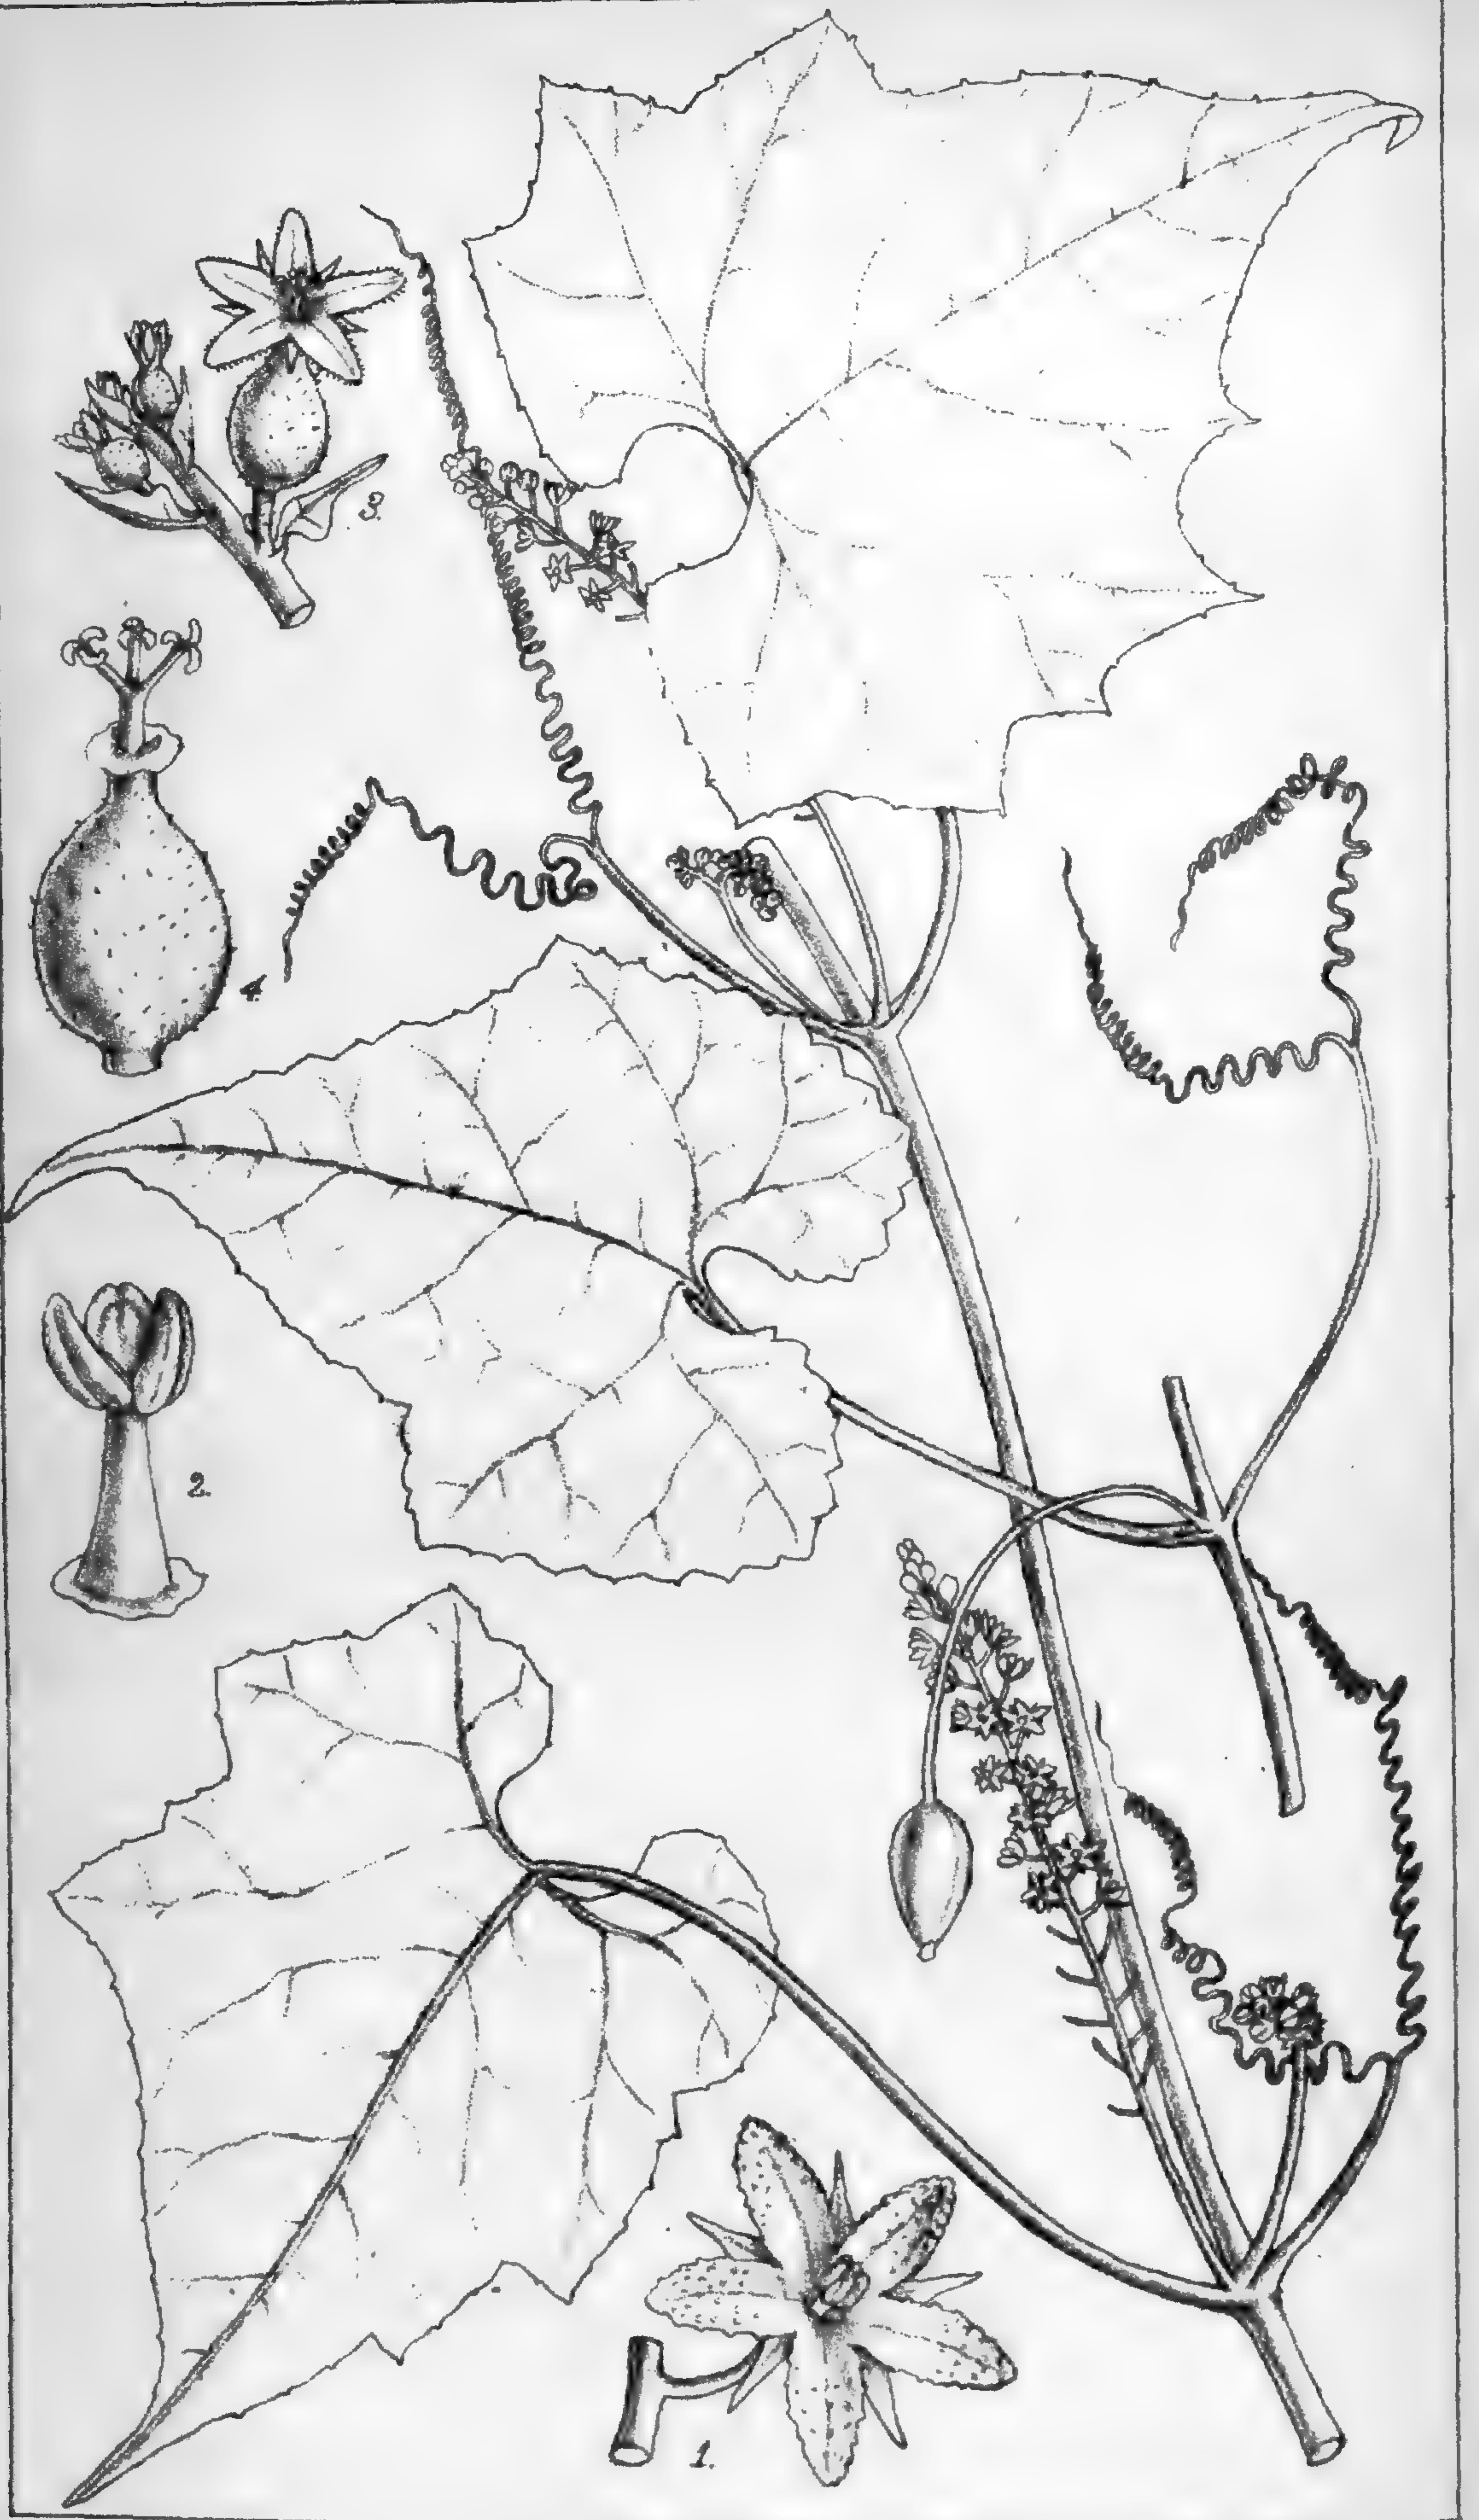

T. ? Henryi, Hemsl. in *Journ. Linn. Soc.* xxiii. 316; alte scandens, caule angulato v. profunde sulcato glabro v. interdum parce setuloso v. puberulo, foliis cordiformibus acutis v. cuspidatis indivisis fere æqualiter denticulatis basi sinu profundo rotundato excavatis supra scabris v. scaberulis subtus puberulis glabrativæ, petiolo eglanduloso in foliis superioribus sæpius quam lamina brevior, cirrhis bifidis v. ramo altero interdum obsoleto, fl. ♂ luteis in racemis plurifloris axillaribus sæpe paniculatim aggregatis dispositis, pedicellis gracilibus flore subæquilongis v. inferioribus sæpe 2-3-plo longioribus, calycis tubo turbinato intus squamis 2 ovato-rotundatis obtusis incurvis clauso, lobis tubo æquilongis (v. alabastro 2-plo longioribus) lanceolatis acuminatis, corollæ ad basin 5-partitæ segmentis ovato-oblongis acuminatis longitudinaliter nervosis, staminibus 5, 4 per paria approximatis, filamentis crassiusculis anthera oblongo-elliptica recta æquilongis, fl. ♀ axillaribus sæpius geminis ternisve interdum longe pedunculatis, corolla maris, staminodiis 5 parvis setuloso-hirsutis, stylo brevi crasso, stigmate dilatato 3-fido segmentis medio sulcatis apice obtuse bidentatis, ovario ovali-oblongo basi intruso tomentello-puberulo et interdum etiam parce setuloso-pilosulo, fructu ellipsoideo pericarpio transversim plicato, seminibus compressis oblongo-obovoidæis testa crustacea sublæve per margines bivalve.

HAB. China, Prov. Hupeh, districts of Patung, Chiensih and Hsingshan, Dr. A. Henry (Nos. 1,757, 5,900, 5,936, 6,563), apparently also a form of the same from Szechuen, Mount Omei, Faber.

Folia inferiora 4-8 poll. longa, 3½-6 poll. lata; petiolus 2-5 poll. longus. Flores ♂ 1½ poll. diam.; fl. ♀ cum ovario 1½-2 poll. longi. Fructus 2½-4 poll. diametro. Semina ¼ poll. longa.

I have thought it best to figure this as it was named by Mr. Hemsley, though my friend M. Cogniaux, on his first inspection of Dr. Henry's specimens, referred it to *Momordica*, I believe on the ground of the two calycine squamæ. On further examination, however, and comparison with a plant in the Paris Herbarium, upon which M. Cogniaux proposes to base a new genus, he inclines to regard *Thladiantha? Henryi* as a congener, and may probably publish it under the new generic name of *Thladianthopsis*. An ovary with the base similarly intruded occurs in *Thladiantha longifolia*, *T. verrucosa*, and *T. glabra*, Cogn. *T. Oliveri*, Cogn., has a broad truncate base, and *T. maculata*, Cogn., a narrow base, terminating abruptly. These specific names are still in manuscript in M. Cogniaux's determinations of Dr. Henry's Chinese Cucurbitaceæ.—D. OLIVER.

Fig. 1. Portion of calyx-tube, showing insertion of stamens and calycine squamæ. 2. Anther, back and front view. 3. Ovary, with staminodia, style, and stigmas. 4. Seed. 5. Embryo. 6. Fruit. Excepting No. 6, enlarged.

M.S. del, et lith.

Schizopepon dioicus, Cogn.

PLATE 2224.

SCHIZOPEPON DIOICUS, Cogn.

CUCURBITACEÆ. Tribe GYNOSTEMMEÆ.

S. dioicus, Cogn. MS. in litt.; gracilis scandens, caule glabro, foliis membranaceis late ovato-cordatis acuminatis basi sinu rotundato excavatis utrinque 2-3-deltoideo-lobatis minute denticulatis glabris v. pauce setulosis lamina petiolo æquilonga v. sæpius longiore, cirrhis bifidis floribus ♂ parvis ebracteatis in racemis v. paniculis racemiformibus angustis gracilibus axillaribus dispositis, calycis lobis lineari-subulatis corollæ lobis oblongo-lanceolatis obtusis brevioribus, staminibus 3 (2 biloc., 1 uniloc.), filamentis ad apicem coalitis, antheris liberis v. basi brevissime connatis, fl ♀ ovario ovoideo apice producto glabro 3-loculare, ovalis solitariis pendulis, staminum rudimentis minutis, stylo apice 3-fido, fructu solitario longiuscule et graciliter pedunculato, ovoideo v. oblongo-ovoideo pericarpio tenui plus minus longitudinaliter verrucoso.

HAB. China, Prov. Hupeh, Districts of Patung and Chiensih, Dr. A. Henry (Nos. 4,862, 5,991).

Folia $1\frac{3}{4}$ -3 (-4) poll. longa, $1\frac{1}{2}$ - $2\frac{1}{2}$ (-3) poll. lata. Flores ♂ $\frac{1}{10}$ poll. diam. Fructus 5-6 lin. longus; pedunculo fructifero $1-1\frac{1}{2}$ poll. longo.

Though the fruit appears to be solitary on slender elongate peduncles without evidence of fallen flowers, yet I find, sometimes in the same axil, an abbreviated few-flowered inflorescence of small ♀ flowers.

This plant with its monadelphous stamens forms a connecting link with *Gynostemma*.—D. OLIVER.

Fig. 1. Staminate flower. 2. Staminal column and anthers. 3. Pistillate flowers. 4. Ovary and style-branches. All enlarged.

R. glandulosa, *Thunb. Fl. Cap. (Ed. Schult.)*, 692; frutex 3-5-pedalis, ramulis foliiferis rigidis divaricatis, foliis oppositis parvis in ramulis elongatis internodiis brevioribus lineari-oblongis v. oblanceolatis plus minus obtusis minute cano-tomentosis, costa subtus conspicue carinatis, deinde præcipue in margine et carina inferiore glandulosis, capitulis heterogamis multifloris campanulato-turbinatis terminalibus sessilibus, squamis pluriseriatis imbricatis marginibus apicem versus late scariosis interioribus oblongis inferne coriaceis, receptaculo paleis paucis elongatis setiformibus superne leviter dilatatis apice acuminatis floribus disci subæquilongis instructo, pappo 1-seriato paleis inæqualibus angustis integris v. laciniatis ovario multo brevior. *DC. Prodr.* vi. 280; *Harv. and Sond. Fl. Cap.* iii. 294.

HAB. Cape Colony, *Thunberg*; between Reed River and Stink-Fontein (No. 1,390), and between Kleine Quakka Fontein and Dwaal Rivier (No. 1,456), *Burchell*; Vaal River, *Dr. Shaw* (No. 110).

Folia $\frac{1}{4}$ - $\frac{1}{2}$ poll. longa. *Involucra* $\frac{1}{2}$ poll. longa atque lata. *Antheræ* apice connectivo lanceolato, basi loculis in processibus rigidiusculis productæ.

The above description is taken wholly from *Burchell's* specimens, which were identified by Mr. N. E. Brown with *Thunberg's* type-specimens, kindly lent to him for comparison by Dr. Theodore Fries, from the Upsala Herbarium. There are, however, notwithstanding identity in all other particulars, singular differences in respect of the paleæ of the receptacle and pappus. In *Thunberg's* type the florets are sheathed by conduplicate scarious narrow squamæ about twice as long as the ovary. In *Burchell's* plant the receptacle bears but a few (5 to 7) elongate setiform squamæ, rather dilated above, and finely pointed at the apex, and about equal to the disk-florets in length. With regard to the pappus, some at least of the outer florets have, in addition to the short paleaceous pappus, a long seta, about as long as the ovary, which may originate either in the same series with the paleæ or inferior to it. *Lessing*, in his careful description, based upon

Syn. Comp.* 264; *Tanacetum axillare*, *Thunb. Fl. Cap. (Ed. Schultes)* 642.

HAB. Cape, *Thunberg*; near Graaff Reinet, *Bolus* (No. 2,008); near sea, Cow River, *Shaw* (No. 52).

Folia longiora $\frac{2}{3}$ -1 poll. longa, $\frac{1}{2}$ lin. lata. *Capitula* florifera 4-6 lin. longa. *Antheræ* basi inappendiculatæ, apice connectivo oblongo-lanceolato productæ. *Styli* rami truncati.

This plant has the habit of *Nestlera humilis*, but is spinescent, and the florets, besides being heterogamous, are very different.—D. OLIVER.

Fig. 1. Dentate leaf and connate base of pair. 2. Capitulum. 3. Floret. 4. Anthers. 5. Style-branches. 6. Achene. *All enlarged.*

M.S. del. et lith.

Athanasia tridens Oliv.

PLATE 2232.

ATHANASIA TRIDENS, Oliv.

COMPOSITÆ. Tribe ANTHEMIDÆ.

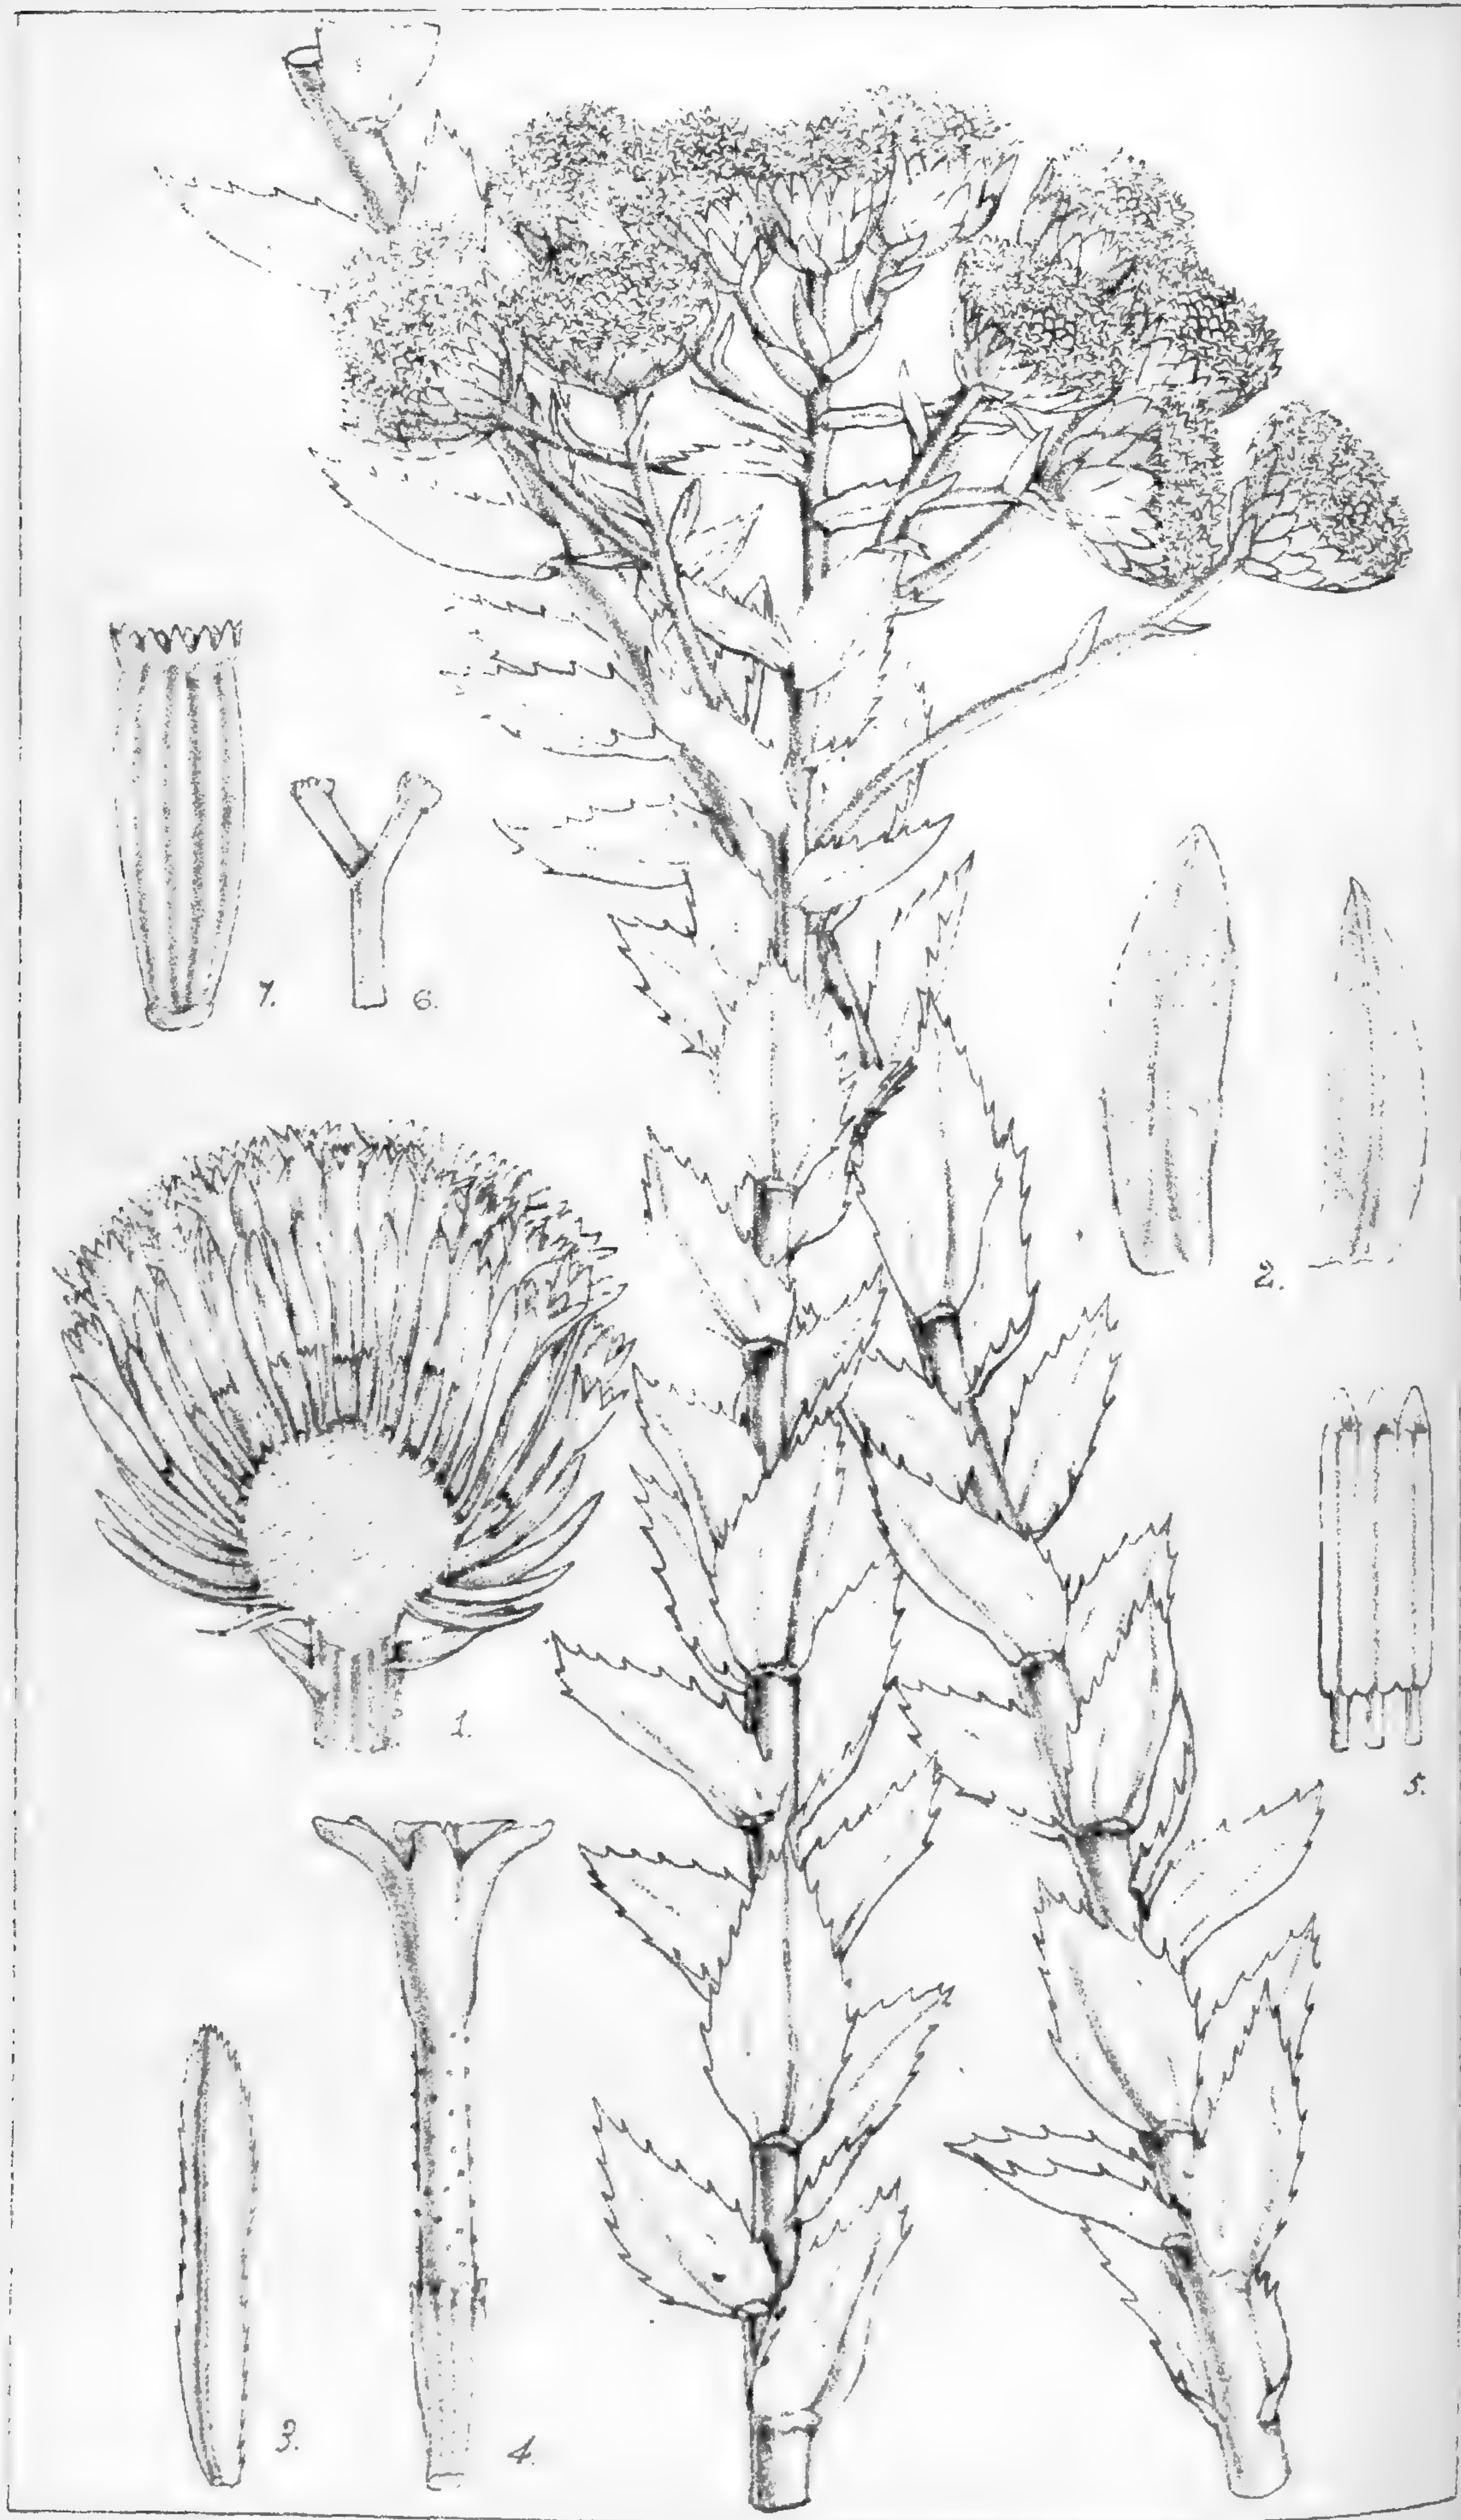

A. tridens, Oliv. (*sp. nov.*); albido-lanata, ramis floriferis erectis virgatis simplicibus fere ad inflorescentiam foliiferis, foliis superioribus minoribus indivisis lineari-lanceolatis inferioribus lineari-oblongis apicem versus cuneatim dilatatis trilobatis marginibus recurvis lobis lanceolatis apiculatis, capitulis multifloris hemisphæricis v. depressoglobosis in cymis terminalibus laxis oligo- (1-5-) cephalis dispositis, involucri squamis 3-5-seriatis plus minus appressis exterioribus minoribus lineari-lanceolatis tenuiter coriaceis dorso dense lanato-tomentosis, paleis receptaculi lineari-subulatis acuminatis ovario duplo longioribus superne leviter serrulatis, corollæ tubulosæ apicem versus leviter dilatatæ lobis recurvis flavidis deltoideo-lanceolatis, ovario valide 8-10-costato costis in dentibus pappi excurrentibus, dentibus minutis interdum bifidis.

HAB. Natal; hills near Blinkwater, 3,000-4,000 feet, *J. M. Wood* (No. 4,315).

Rami floriferi $1\frac{1}{2}$ -pedales teretes albido-tomentosi. *Folia* lanato-tomentosa, inferiora 3-fida $1-1\frac{1}{4}$ poll. longa. *Capitula* $\frac{2}{3}-\frac{3}{4}$ poll. diam. *Antheræ* apice connectivo membranaceo lanceolato obtuso terminatæ.

The florets are very numerous for an *Athanasia*, as large as those of the macrocephalous *Santolinæ*.—D. OLIVER.

Fig. 1. Palea of receptacle. 2. Floret. 3. Anthers. 4. Style-branches. 5. Ovary. *All enlarged.*

M.S. del. et lith.

Athanasia leucoclada, Harv.

PLATE 2233.

ATHANASIA LEUCOCLADA, *Harv.*

COMPOSITÆ. Tribe ANTHEMIDÆÆ.

A. leucoclada, *Harv. Flora Capensis*, iii. 191; ramis floriferis virgatis teretibus albido-tomentosis ad apicem foliiferis, foliis sessilibus amplexicaulibus ovato- v. oblongo-lanceolatis acutis serratis coriaceis glabris utrinque melanostictis, capitulis multifloris hemisphæricis pedunculatis in cymis 10-15-cephalis terminalibus dispositis, involucri glabri v. parce lanati squamis imbricatis pluriseriatis lineari-lanceolatis obtusiusculis acutisve marginibus superne scariosis obsolete erosis, paleis receptaculi floribus fere æquilongis linearibus subacutis coriaceis lateribus reflexis, ovario valide (8-) 10-costato costis in dentibus pappi minutis excurrentibus. *Hymenolepis?* *leucoclada*, *DC. Prodr.* vi. 86.

HAB. South Africa, Griqua East, in the Zuurbergen, 5,000 feet, and in the Malowe Mountains, near Clydesdale, 4,000 feet, *W. Tyson* (Nos. 1,185, 2,057).

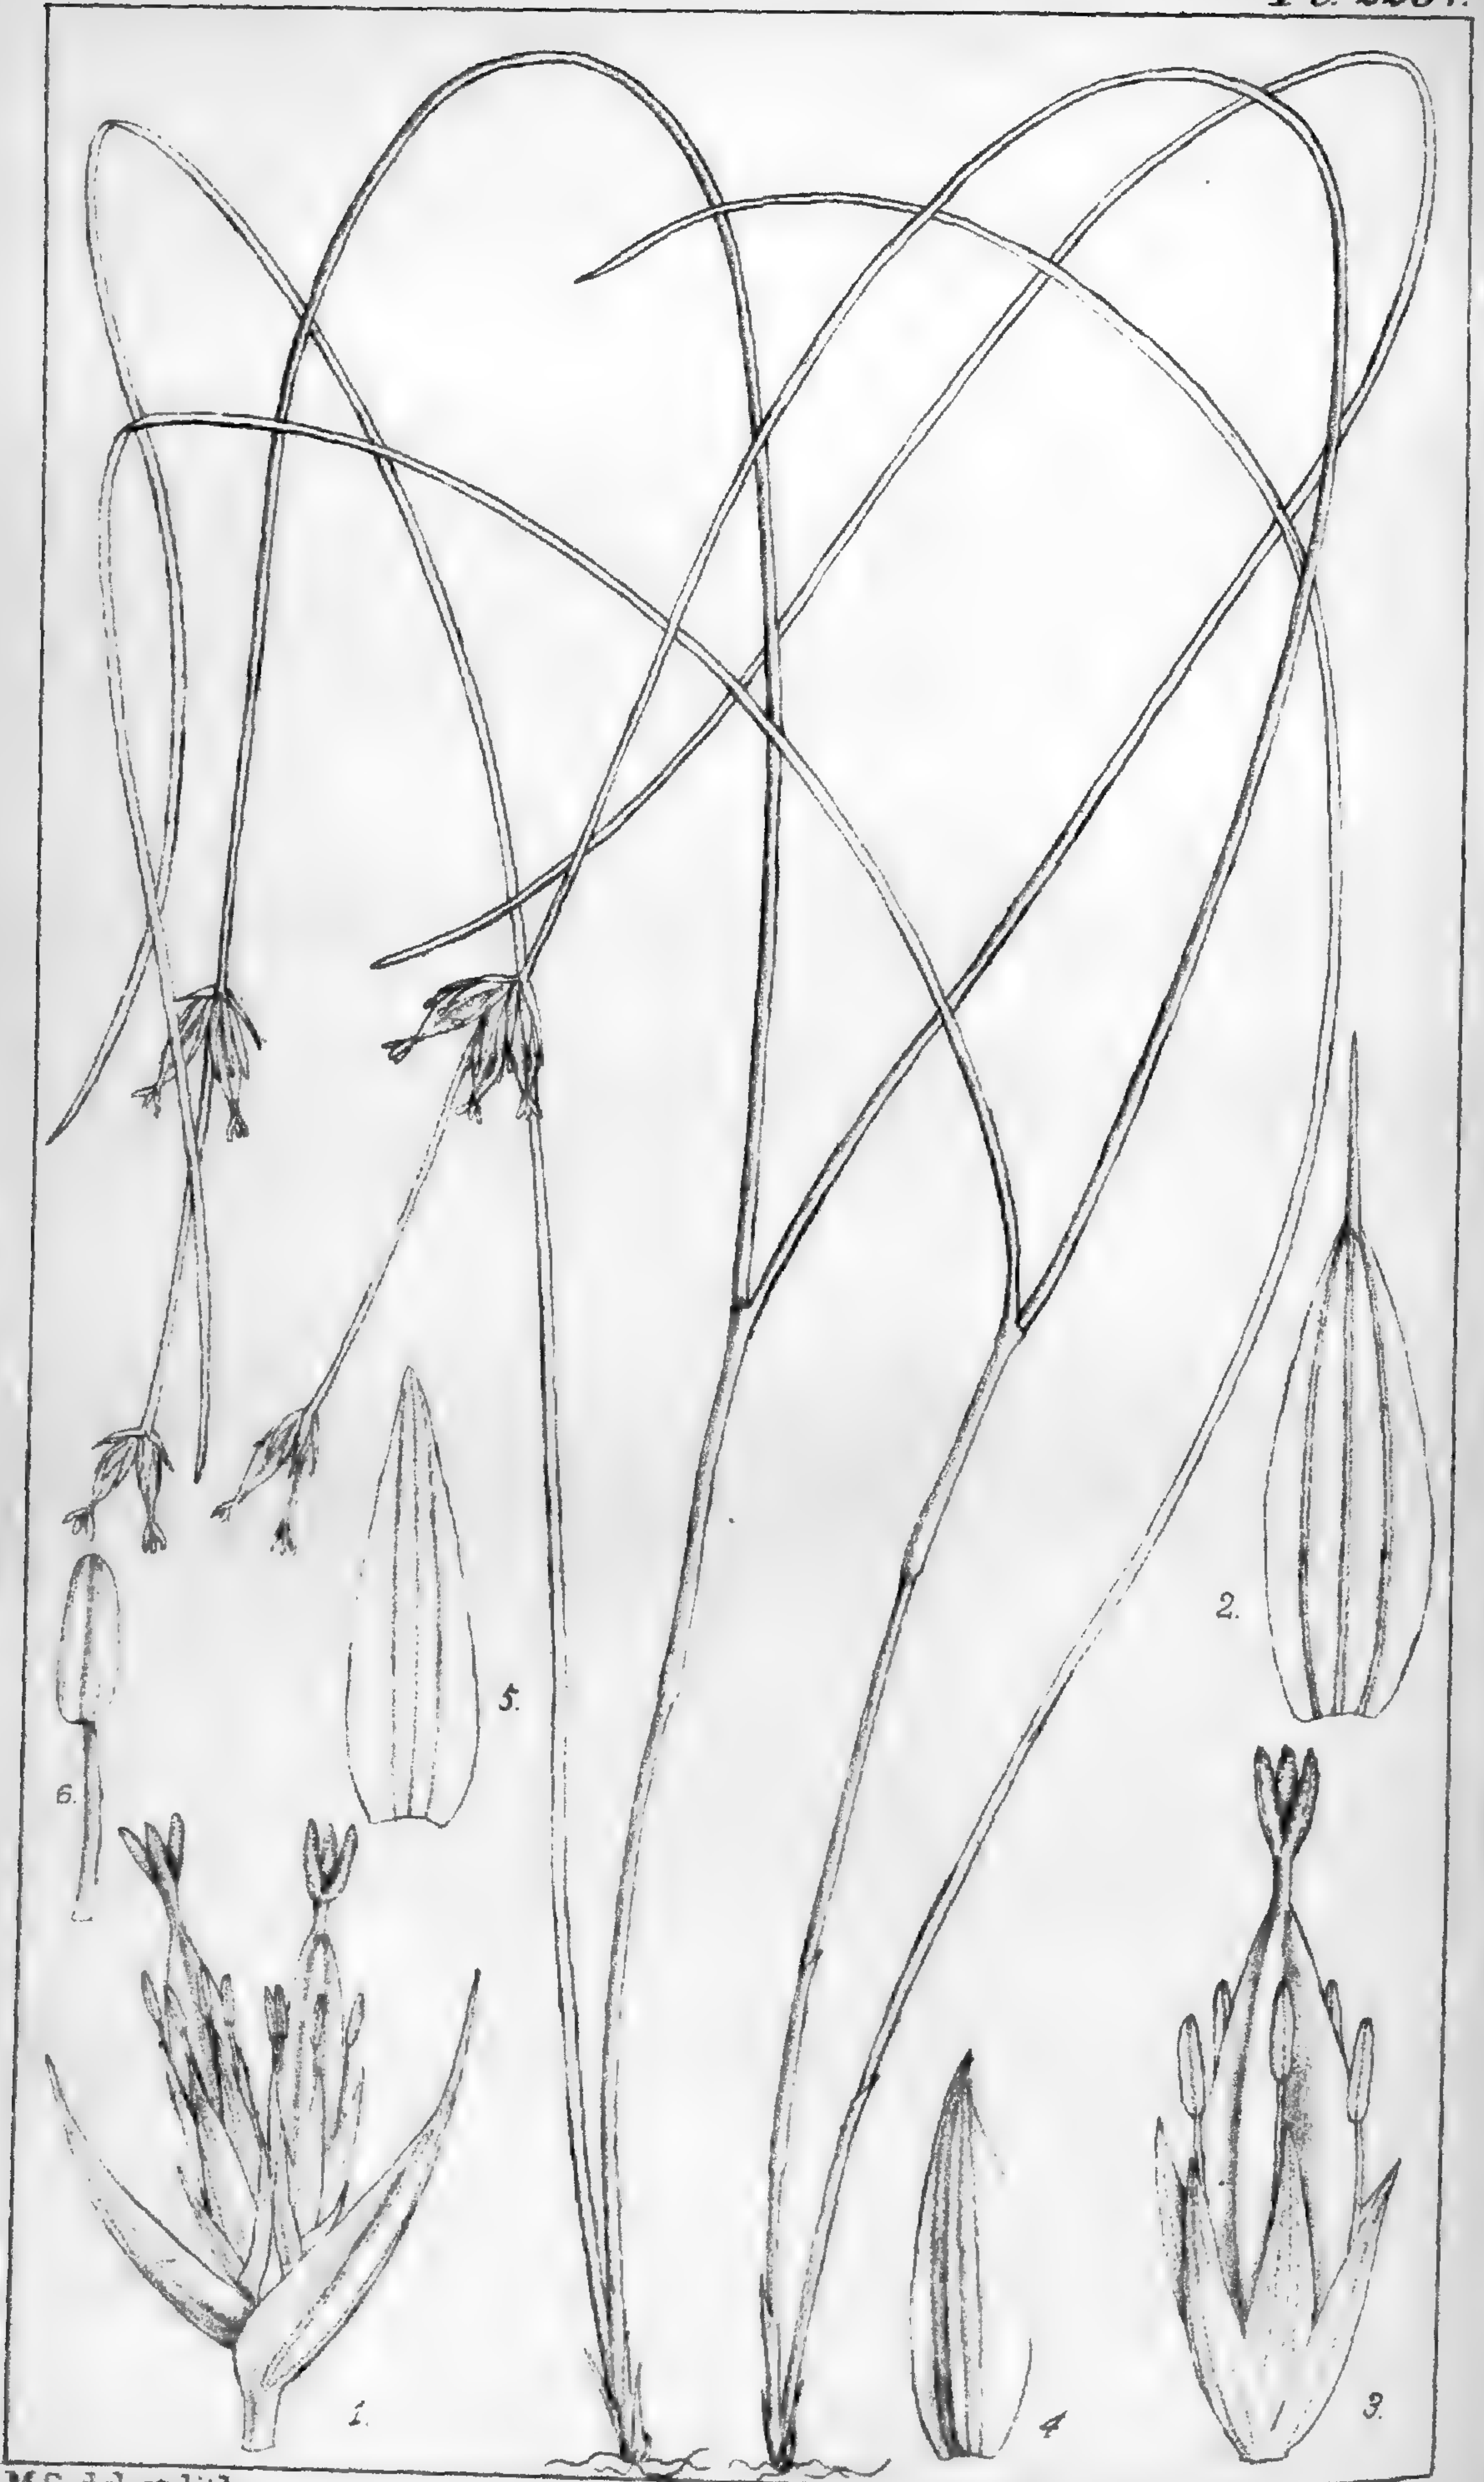

Rami floriferi $1\frac{1}{2}$ -2-pedales. *Folia* internodia obtegentia, caulina inferiora $\frac{2}{3}$ -1- $1\frac{1}{2}$ poll. longa. *Capitula* $\frac{1}{3}$ - $\frac{1}{2}$ poll. diam.

The type of Drege, collected between the Omsamwubo and Omsamcaba, I have not seen; but Mr. Bolus's determination of Mr. Tyson's specimens, which correspond accurately* with De Candolle's description, is doubtless correct.

The plant was also unknown to Harvey, who first transferred the species to *Athanasia*. The achenes and their crowning teeth are similar to those of *A. tridens*, figured on the preceding plate. Mr. J. M. Wood sends from Natal a specimen so similar to Mr. Tyson's plant, except in the glabrescent stem and the slightly larger leaves and capitula, that I can only regard it as a form of the same species (*A. leucoclada* var. *glabrescens*).

Fig. 1. Vertical section of capitulum and solid receptacle. 2. Involucral bracts. 3. Palea of receptacle. 4. Floret. 5. Anthers. 6. Style-branches. 7. Ovary. *All enlarged.*

* The receptacle, however, is solid, not hollow as in *Hymenolepis canorachis*, to which De Candolle doubtfully referred it.

Juncus nematocaulon, Hk. f.

PLATE 2234.

JUNCUS NEMATOCAULON, *Hook. f.*

JUNCACEÆ. Tribe EUJUNCEÆ.

J. nematocaulon, *Hook. f. (sp. nov.)*; caulis cæspitosis foliisque capillaribus canaliculatis flexuosis, floribus solitariis v. in cymas 2-3-floras remotas dispositis, bracteis exterioribus brevibus v. inferioribus capillaribus, floribus sessilibus parvis, sepalis petalisque pallide viridibus lanceolatis acuminatis, antheris longe exsertis filamento capillaceo multo brevioribus, capsula longe exserta prismatica acuminata. *Fl. Brit. Ind.* vi. 400.

HAB. Assam; Naga Hills; on Jalepho, alt. 9,900 feet. *C. B. Clarke.*

Caules (annui?) 1-1½ poll. longi, superne unifoliati, interdum uniflori, flore terminali bractea capillari instructo. *Folia* pauca, vaginis brevibus membranaceis. *Flores* ⅙ poll. longi, bracteis æquilongis membranaceis involuti; sepala et petala consimilia, uninervia. *Capsula* perianthio duplo longior, ⅓ poll. longa, 1-locularis, membranacea, pallida. *Semina* utrinque in caudas elongatas producta, cauda una filiformi, altera æquilonga inflata.

A very remarkable species, allied to *J. khasiensis*, Buchen., in its slender habit, but far more slender, and differing in the few flowers, acute sepals, capsules much longer than the perianth, and seeds with one of the tails inflated. The seeds described are from a drawing by Mr. Clarke; I fail to find any in this specimen.—J. D. H.

Fig. 1. Inflorescence detached. 2. Outer aristate bract. 3. Flower. 4. Outer carinate; and 5, inner perianth-segment. 6. Stamen. *All enlarged.*

M.S. del. et lith.

Juncus sikkimensis, Hk. f.

PLATE 2235.

JUNCUS SIKKIMENSIS, *Hook. f.*

JUNCACEÆ. Tribe EUJUNCEÆ.

J. sikkimensis, *Hook. fil. (sp. nov.)*; rhizomate repente, vaginis ad basin caulis rigidis, foliis solitariis paucisve caulem æquantibus teretibus v. subcompressis, cyma e capitulis 2 lateralibus sessilibus 4-6-floris, bracteis inferioribus foliaceis cymam superantibus, sepalis glumaceis brunneis lanceolatis acuminatis, petalis lineari-oblongis obtusis, antheris inclusis filamentis multo longioribus, capsula inclusa, seminibus utrinque in caudam brevem productis. *Fl. Brit. Ind.* vi. 399.

HAB. Sikkim Himalaya; Lachen Valley, alt. 12,000-14,000 feet, *J. D. H.*

Rhizoma crassitie pennæ corvinæ v. passerinæ; caules spithamei, canaliculati foliaque solidi; vaginæ $\frac{1}{2}$ -1-pollicares. *Flores* $\frac{1}{3}$ - $\frac{1}{2}$ poll. longi, sessiles, bracteis æquilongis membranaceis involuti; sepala tenuiter acuminata, nitida; petala apice membranacea; antheræ lineares, demum tortæ; ovarium parvum, stylo gracili elongato exserto, stigmatibus elongatis. *Capsula* sepalis vix longior, obovoidea, acuta, breviter rostrata, castanea, nitida, 3-septata. *Semina* $\frac{1}{2}$ poll. longa, candidis albis.

Var. *monocephala*; parvula, caule gracillimo, cyma monocephala, bracteis inferioribus filiformibus $\frac{1}{2}$ - $\frac{3}{4}$ poll. longis, sepalis $\frac{1}{5}$ poll. longis. *Fl. Brit. Ind.* l.c., Sikkim, alt. 12,000 feet.

Allied to *J. himalensis*, Kl. and Garcke (which is very near the European *J. castaneus*), differing in the solid stems and leaves, sessile flowers, finely acuminate sepals, anthers longer than the filaments, much shorter capsule, and far smaller seeds with short stout tails. The larger forms, from 12,000 feet, a span high and more, have fewer leaves, stouter stems, and dark brown basal sheaths, and spathaceous outer bracts; in more slender forms, from 13,000-15,000 feet, the basal sheaths are much more membranous, the lower bracts less spathaceous and flowers fewer. The var. *monocephala* looks like a different species, owing to the smaller size of all its parts, but I find no difference in the structure of its flowers.—*J. D. H.*

Fig. 1. Flower. 2. Same laid open. 3. Apex of perianth-segment. 4. Flower of var. *monocephala*. 5. Pistil of same. *All enlarged.*

PLATE 2236.

IXORA SIPHONANTHA, *Oliv.*

RUBIACEÆ. Tribe IXOREÆ.

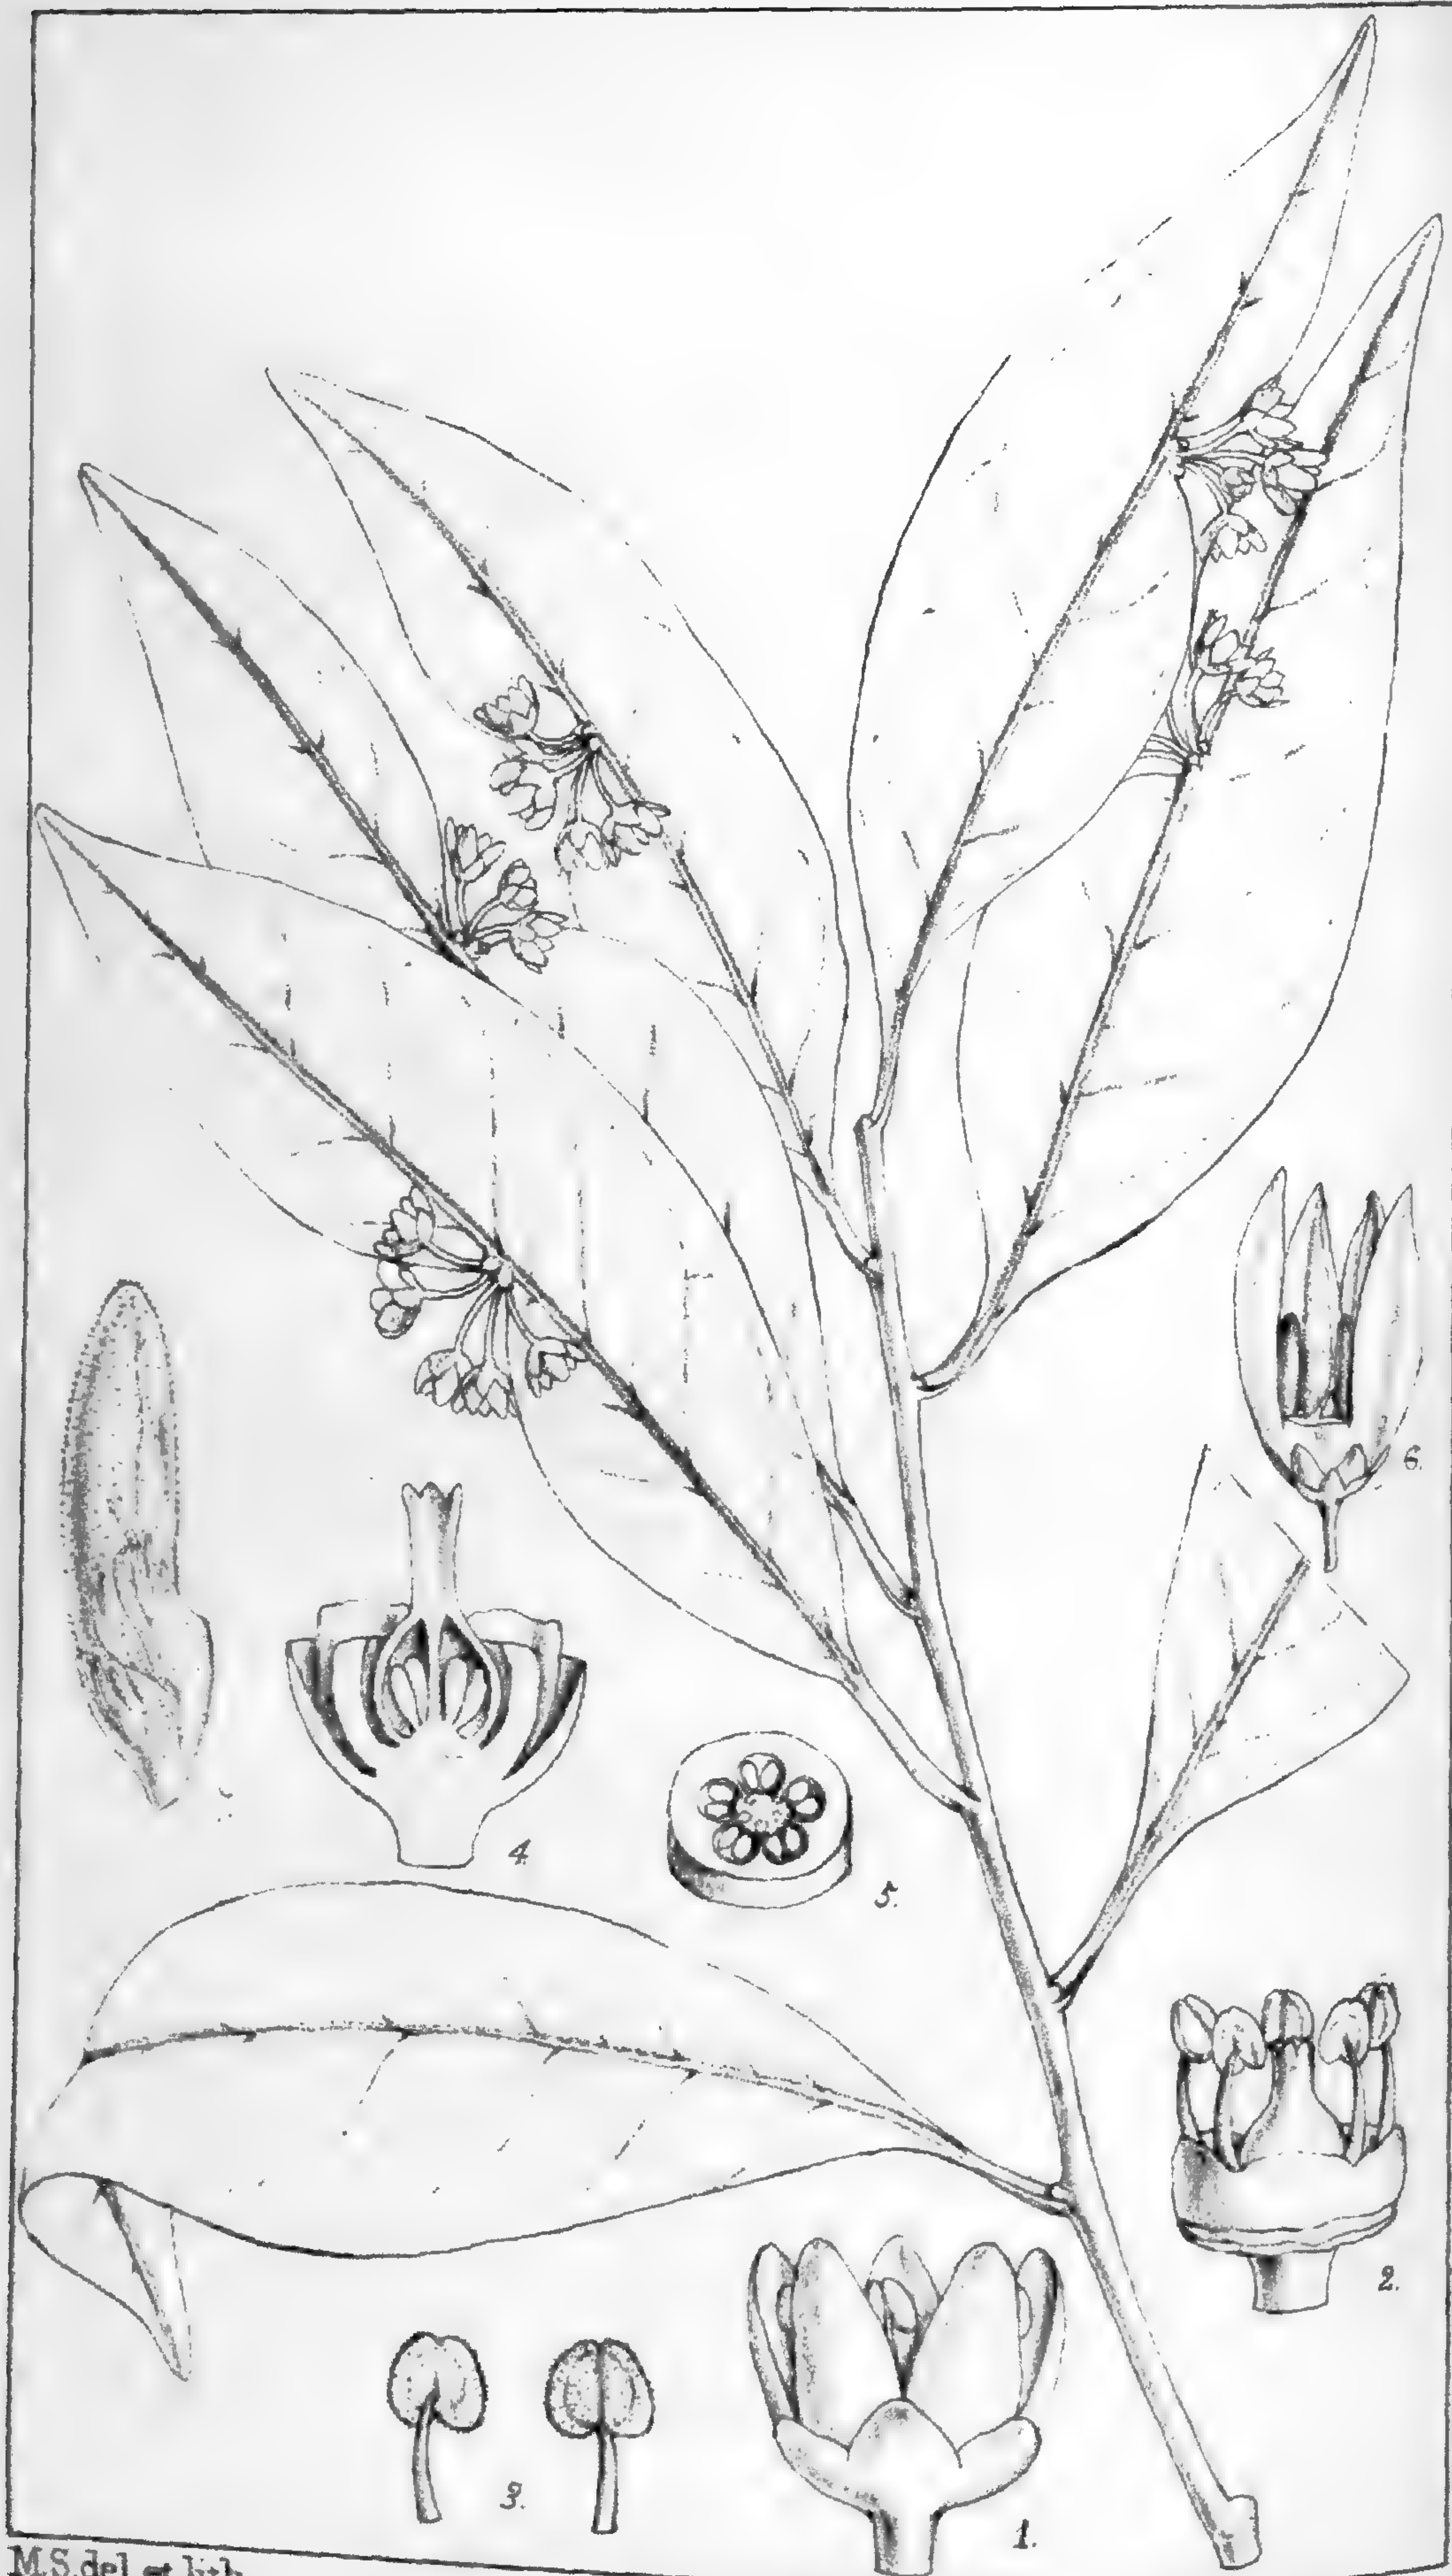

I. siphonantha, *Oliv. (sp. nov.)*; glaberrima, foliis petiolatis elongato-ovalibus acutis coriaceis, stipulis connatis cuspidatis, panicula terminali dependente pedunculata trichotoma, bracteis lanceolato-subulatis acutis, pedicellis ultimis brevissimis vel floribus sessilibus, calycis tubo campanulato limbo 4-partito brevior, segmentis limbi erectis lanceolatis acutis rigidiusculis, corollæ tubo longissimo gracili, limbi lobis lineari-lanceolatis acutis, antheris fauce insertis linearibus apice apiculatis lobis corollæ c. 4-plo brevioribus, filamentis brevissimis, stigmatis lobis linearibus divergentibus.

HAB. Northern Madagascar, *Baron* (No. 6,611.)

Folia (in ram. florif.) 7-10 poll. longa, $1\frac{1}{2}$ - $2\frac{1}{2}$ poll. lata. *Panicula* cum pedunculo c. $1\frac{1}{2}$ -2 pedalis. *Flores* flavi, 8-10 poll. longi. *Calyx* lobis 2- $2\frac{1}{2}$ lin. longis. *Ovula* solitaria, peltatim inserta.

A noble addition to this large genus. I do not know any species of *Ixora* with flowers so large.—D. OLIVER.

Fig. 1. Calyx and style-base. 2. Anther, front and back. 3. Longitudinal section of ovary. *All enlarged.*

M.S. del. et lith.

Polycardia Baroniana, Oliv.

PLATE 2237.

POLYCARDIA BARONIANA, Oliv.

CELASTRINEÆ. Tribe CELASTREÆ.

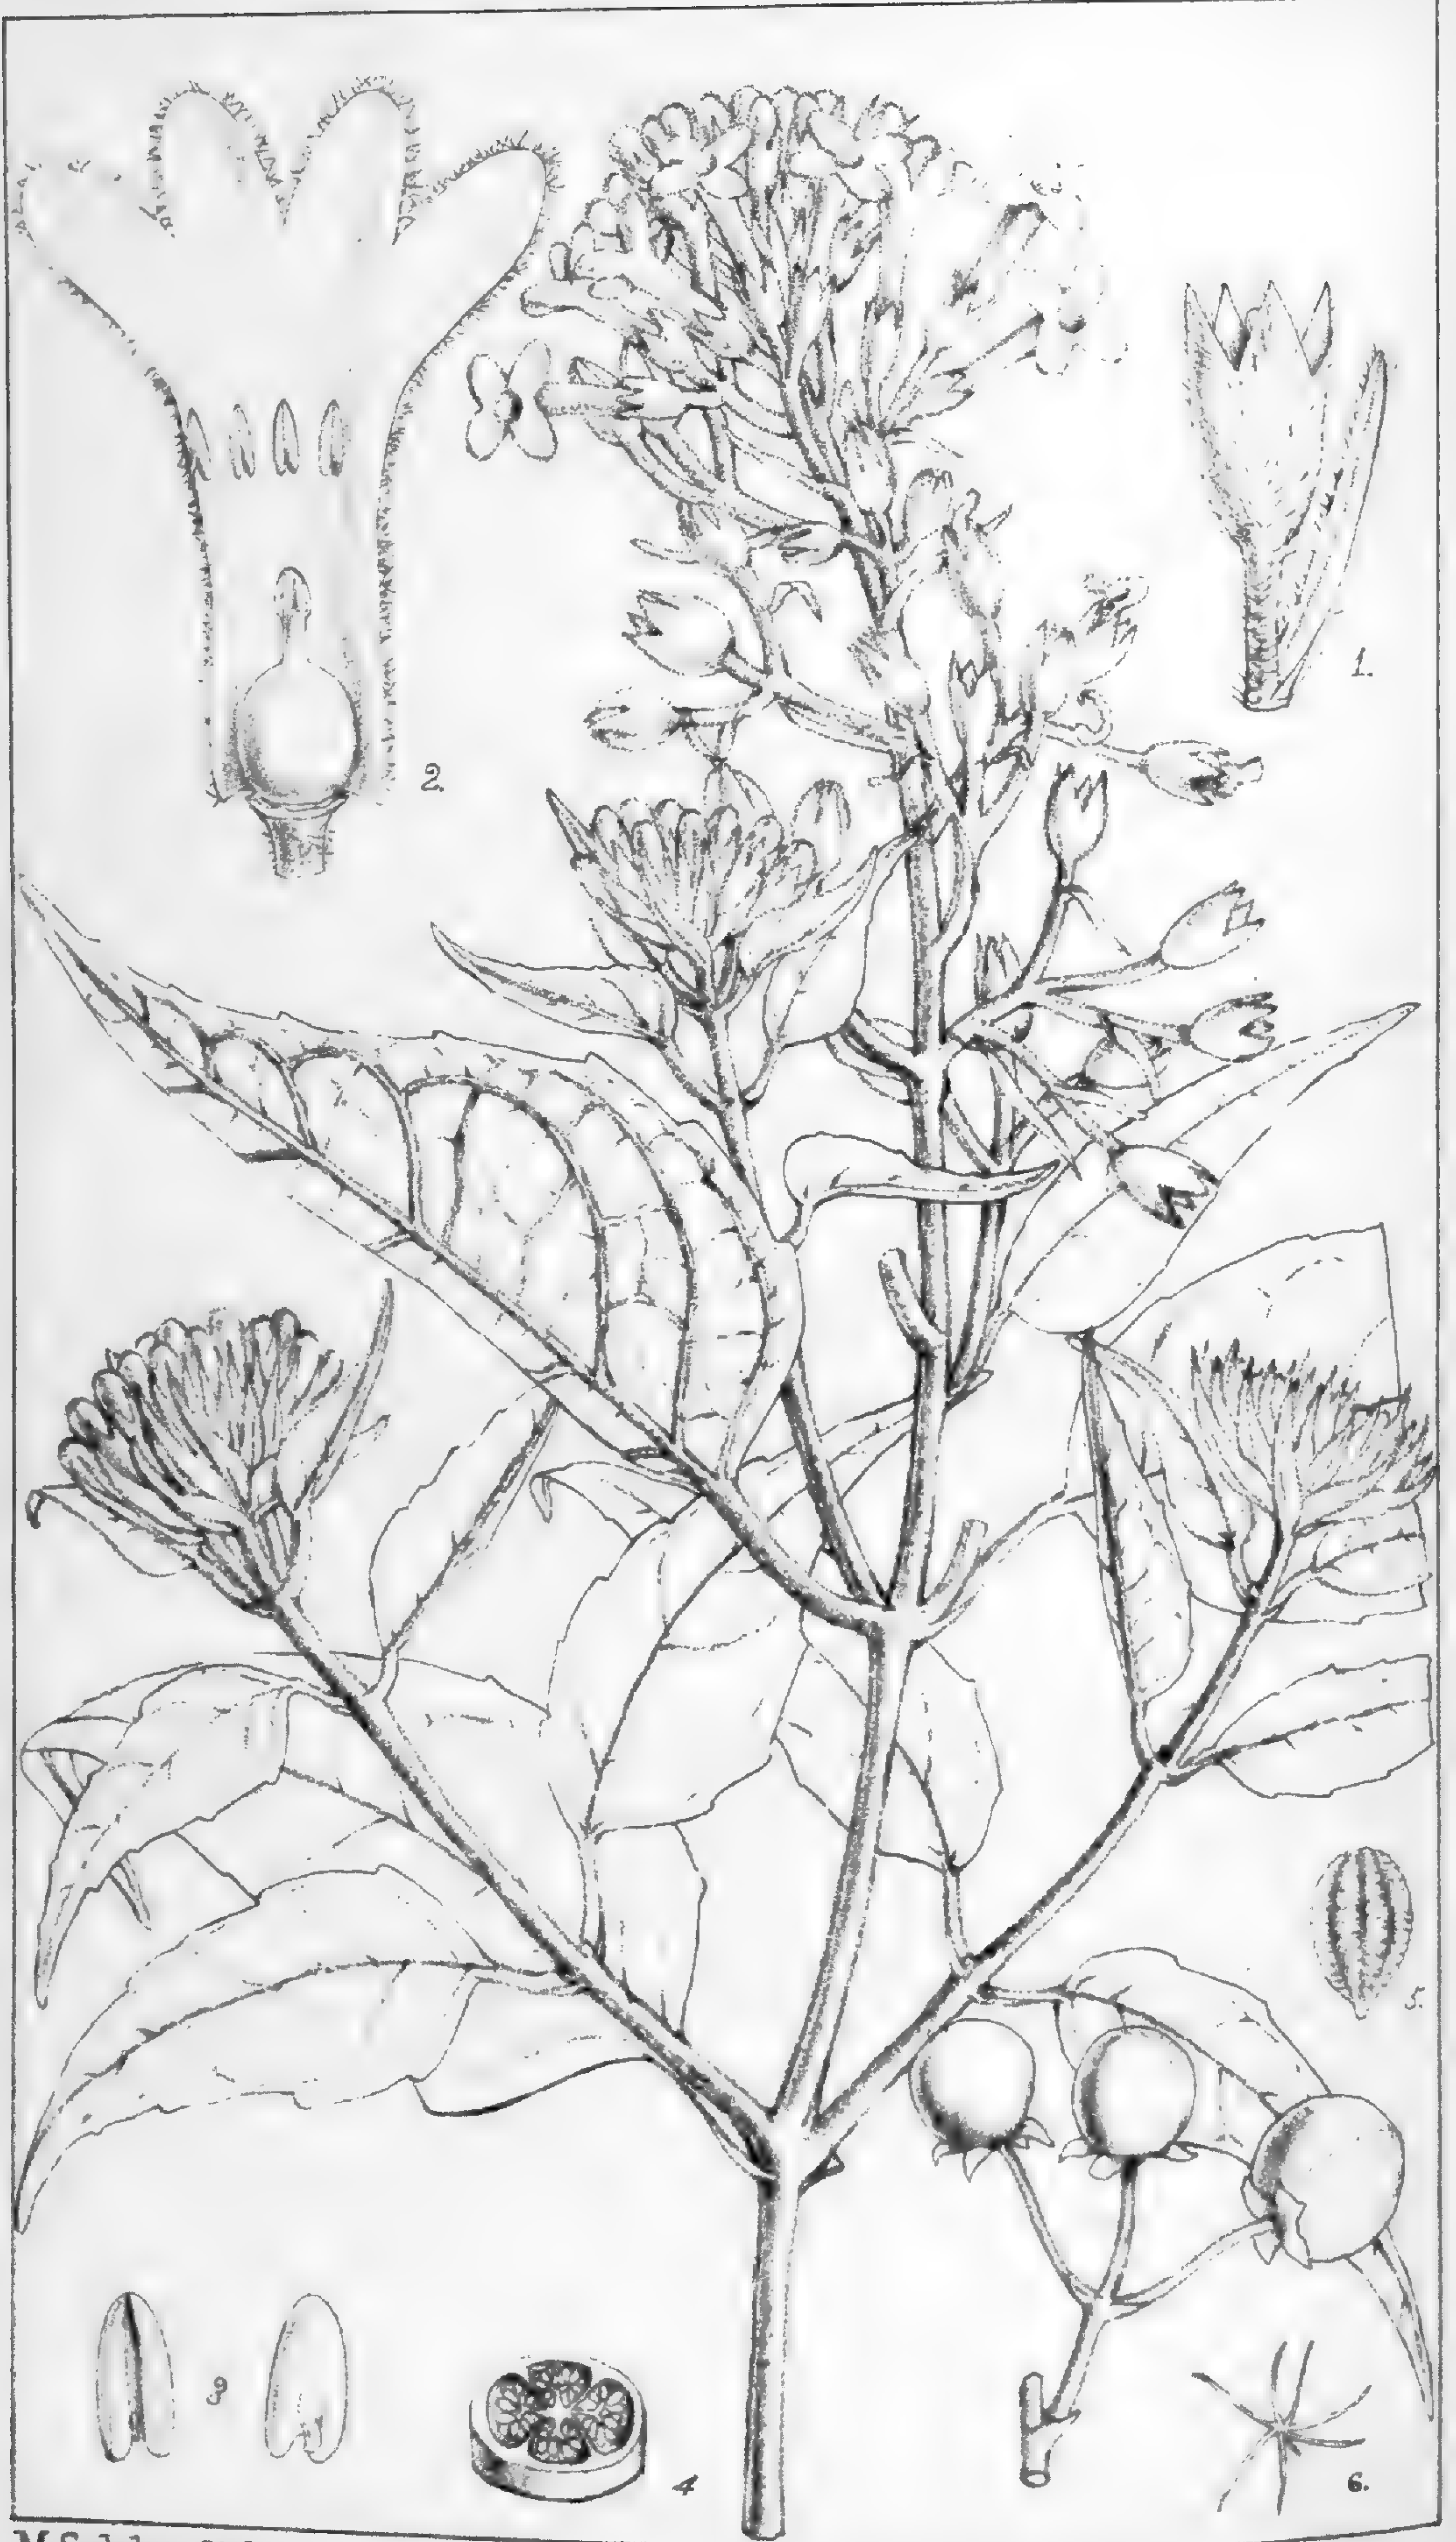

P. baroniana, Oliv. (*sp. nov.*); glaberrima, ramulis gracilibus, foliis petiolatis coriaceis ovali-oblongis obtusiusculis sæpe breviter acuminatis basi in petiolum angustatis venis primariis obscuris v. subtus vix prominulis, uno latere prope v. supra medium ad costam excavatis et hic flores pedicellatos 3-8-fasciculatos gerentibus, calycis 5-fidi lobis ovato-deltoideis, petalis calyce 2-3-plo longioribus ovatis v. ovato-lanceolatis obtusis persistentibus, ovarii loculis 2-3-ovulatis, capsula elliptica loculicide 5-valve, seminibus angustis minute pubescentibus basi arillo oblique laciniato instructis.

HAB. North Madagascar, *Baron* (No. 6,243).

Folia $2\frac{1}{4}$ -4 poll. longa, $\frac{1}{2}$ - $1\frac{1}{6}$ poll. lata; *petiolus* $\frac{1}{4}$ - $\frac{1}{2}$ poll. longus. *Pedicelli* $\frac{1}{4}$ poll. longi. *Stamina* in sinibus disci inserta, petalis breviora; filamenta subulata; antheræ ovato-cordatæ, obtusæ, scabridopunctatæ, antice sulcatæ, dorso convexæ. *Ovarium* superum, ovoideum, disco circumdatum; *stylus* lævis crassus; *stigmatæ* 3-5-lobulato. *Capsula* valvis tenuiter crustaceis ovalibus utrinque acutatis, 10-12 lin. longis.

This plant agrees with *P. Hildebrandtii*, Baill. (*P. lateralis*, Hoffm.), in the inflorescence originating from the base of a lateral sinus of the leaf, but differs in the much longer, more oblong, more obtuse pale leaves, and the floral sinus, instead of being near the base of the leaf, is at or above the middle: in this respect our plant is nearer Hildebrandt's No. 3,460, if not identical with it.—D. OLIVER.

Fig. 1. Flower. 2. Flower, the sepals and petals removed. 3. Stamen, back and front view. 4. Vertical section of ovary. 5. Transverse section of same. 6. Dehiscent capsule. 7. Seed, with arillus. *Except fig. 6, enlarged.*

M.S. del. et lith.

Nicodemia Baroniana, Oliv.

PLATE 2238.

NICODEMIA BARONIANA, *Oliv.*

LOGANIACEÆ. Subtribe BUDDLEIÆ.

N. baroniana, *Oliv. (sp. nov.)*; ramulis hornotinis cano-tomentellis, foliis petiolatis lanceolatis v. ovato-lanceolatis acuminatis apice acutiusculis integris vel utrinque 1-3-repando-dentatis supra parce stellato-tomentellis deinde glabratis subtus cum petiolo cano-tomentosis, paniculis v. racemis compositis multifloris terminalibus, pedunculis pedicellisque floriferis dense tomentosus, bracteis anguste linearibus, calycis tomentosi campanulati 4-fidi lobis ovato-lanceolatis acutis, corollæ tubo calyce 2-3-plo longiore parce tomentello, limbo 4-fido, lobis ovato-rotundatis, antheris paullo supra medium tubi insertis subsessilibus oblongis, ovario 4-loculari globoso stylo æquilongo, stigmate leviter dilatato, fructibus globosis lævibus basi calyce persistente stipatis, seminibus ∞ ellipsoideis longitudinaliter sulcatis et transverse rugulosis.

HAB. Northern Madagascar, *Baron* (No. 6,277, 6,507).

Ramuli graciles crassitie pennæ corvinæ. *Folia* $2\frac{1}{2}$ -4 poll. longa; $\frac{3}{4}$ - $1\frac{1}{2}$ poll. lata; petiolus $\frac{1}{4}$ - $\frac{2}{3}$ poll. longus. *Flores* $\frac{3}{4}$ poll. longi; pedunculi pedicellique fructiferi divaricati sæpe glabrescentes. *Fructus* $\frac{1}{4}$ poll. diam.

The stigma falls considerably short of the stamens in the flower examined. It is not improbable that the flowers may prove dimorphic, and that a long-styled form occurs. I leave the genus in *Nicodemia* for the present, notwithstanding, as first observed by Miss Smith, the ovary and fruit are quadrilocular, with very thin dissepiments.—
D. OLIVER.

Fig. 1. Calyx and subtending bract. 2. Corolla, laid open, and pistil. 3. Anther, back and front view. 4. Transverse section of ovary. 5. Seed. 6. Stellate hair of indumentum. *All enlarged.*

RUTACEÆ. Tribe BORONIEÆ.

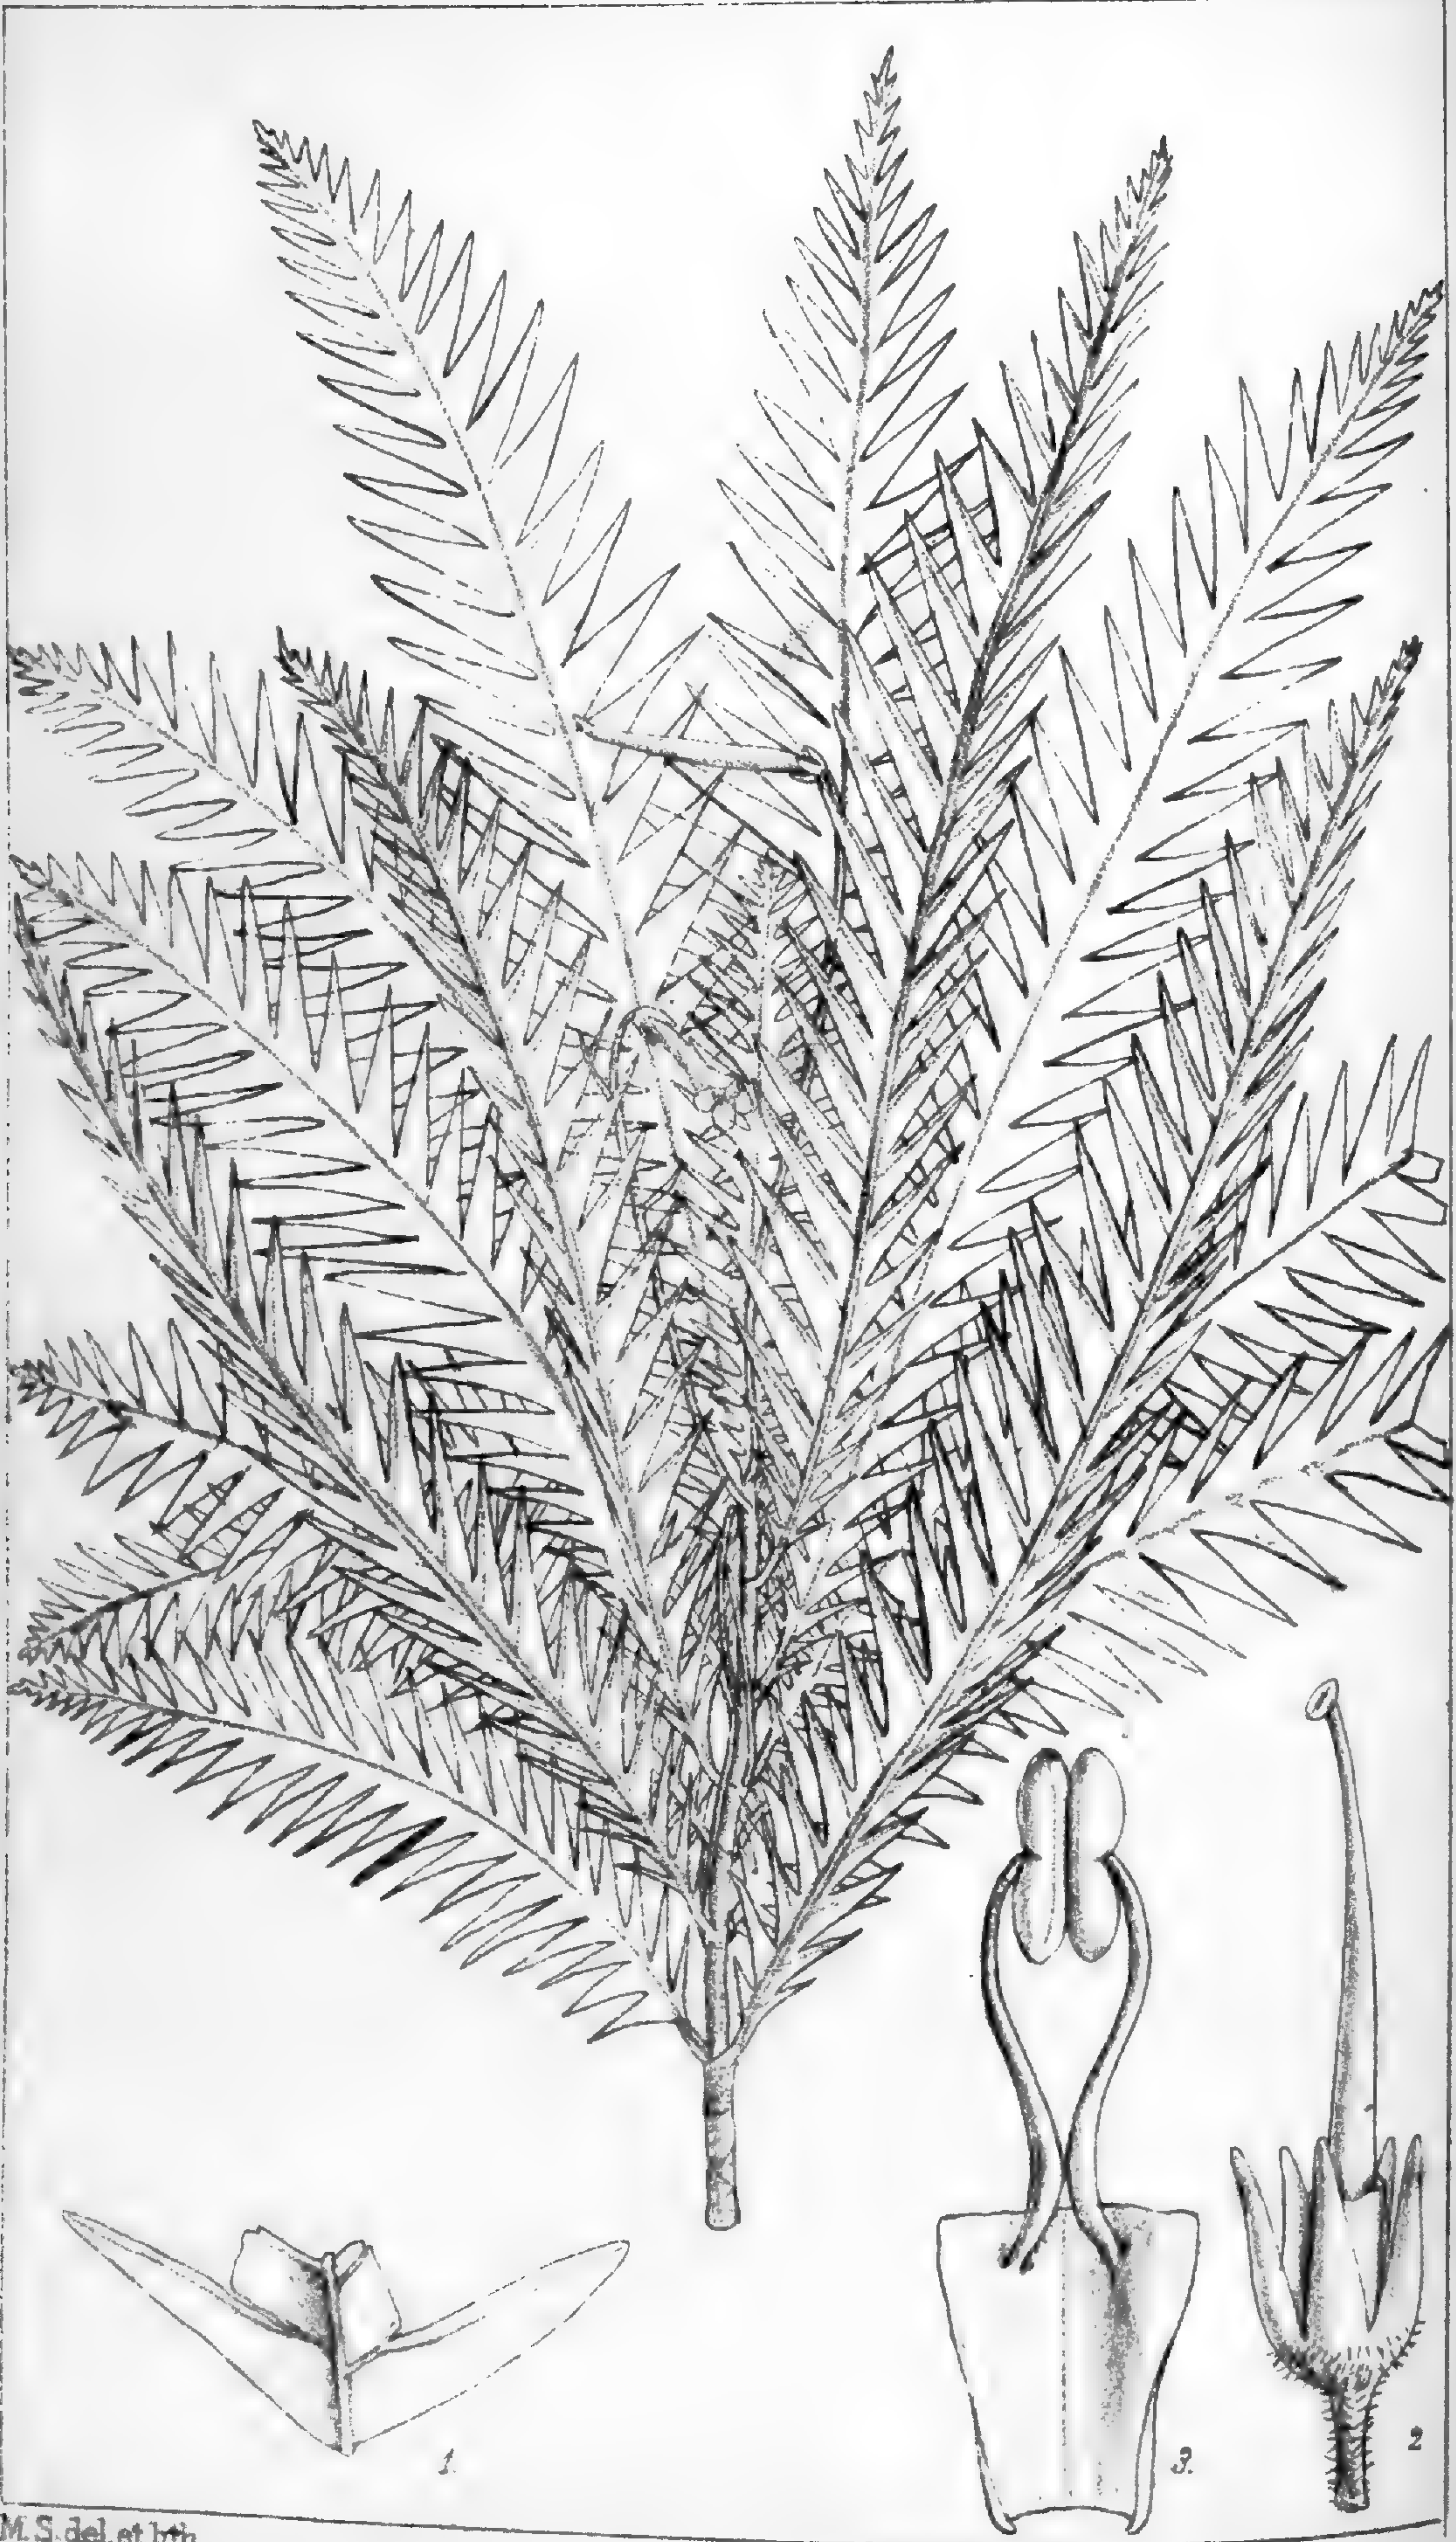

C. Bauerlenii, *F. v. Mueller in Proc. Linn. Soc. N. S. Wales*, ix. 960; ramulis gracilibus teretibus, novellis porphyreo-brunneis pilis stellatis plus minus obsitis, foliis oppositis petiolatis tenuiter coriaceis oblongo- v. ovali-lanceolatis acutiusculis planis subtus pilis ferrugineis parce notatis, floribus flavido-virescentibus pedunculatis axillaribus v. terminalibus, calyce mox glabrato ore breviter 4-dentato sæpius irregulariter fisso v. quasi-bilabiato prope basin tubi horizontaliter alato-dilatato, corolla gamopetala extus pilis stellatis pallidis tomentella tubulosa cylindrica calyce 3-4-plo longiore, breviter 4-lobata, lobis ovato-deltoideis acutis vix patulis, staminibus exsertis, filamentis glabris anguste lineari-subulatis, antheris lineari-oblongis versatilibus, ovario hirsuto 4-partito, coccis glabrescentibus 'valvis endocarpium sursum dilatatis, seminibus nitentibus brunneis, cotyledonibus radiculae fere æquilongis.'

HAB. New South Wales, 'on stony banks of rivulets of the Upper Clyde,' *W. Bauerlen*.

Folia $1\frac{1}{2}$ - $2\frac{1}{2}$ poll. longa, $\frac{1}{2}$ - $\frac{3}{4}$ poll. lata; *petiolus* 1-3 lin. longus. *Flores* 1 poll. longi. *Calyx* ala basali coriacea 1-2 lin. lata demum decurva.

Sir F. von Mueller, to whom we are indebted for excellent flowering specimens, wild ones from the restricted original locality, sent to Kew in 1884, and recently cultivated specimens from Port Phillip, suggests that this species is deserving of a figure in 'Icones Plantarum' as 'one of the rarest plants of Australia' and 'of singular structural interest.' The latter remark applies to the horizontal wing-like expansion of the base of the calyx, unlike anything in allied Rutaceæ. Sir F. v. Mueller remarks that 'several of the most local plants in Australia are contained in the order *Rutaceæ*.' The finely narrowed apex of the filaments is continued into, and concealed by, an extinguisher-like excavation of the connective, as in *Correa speciosa*.—
D. OLIVER.

MALVACEÆ. Subtribe SIDEÆ.

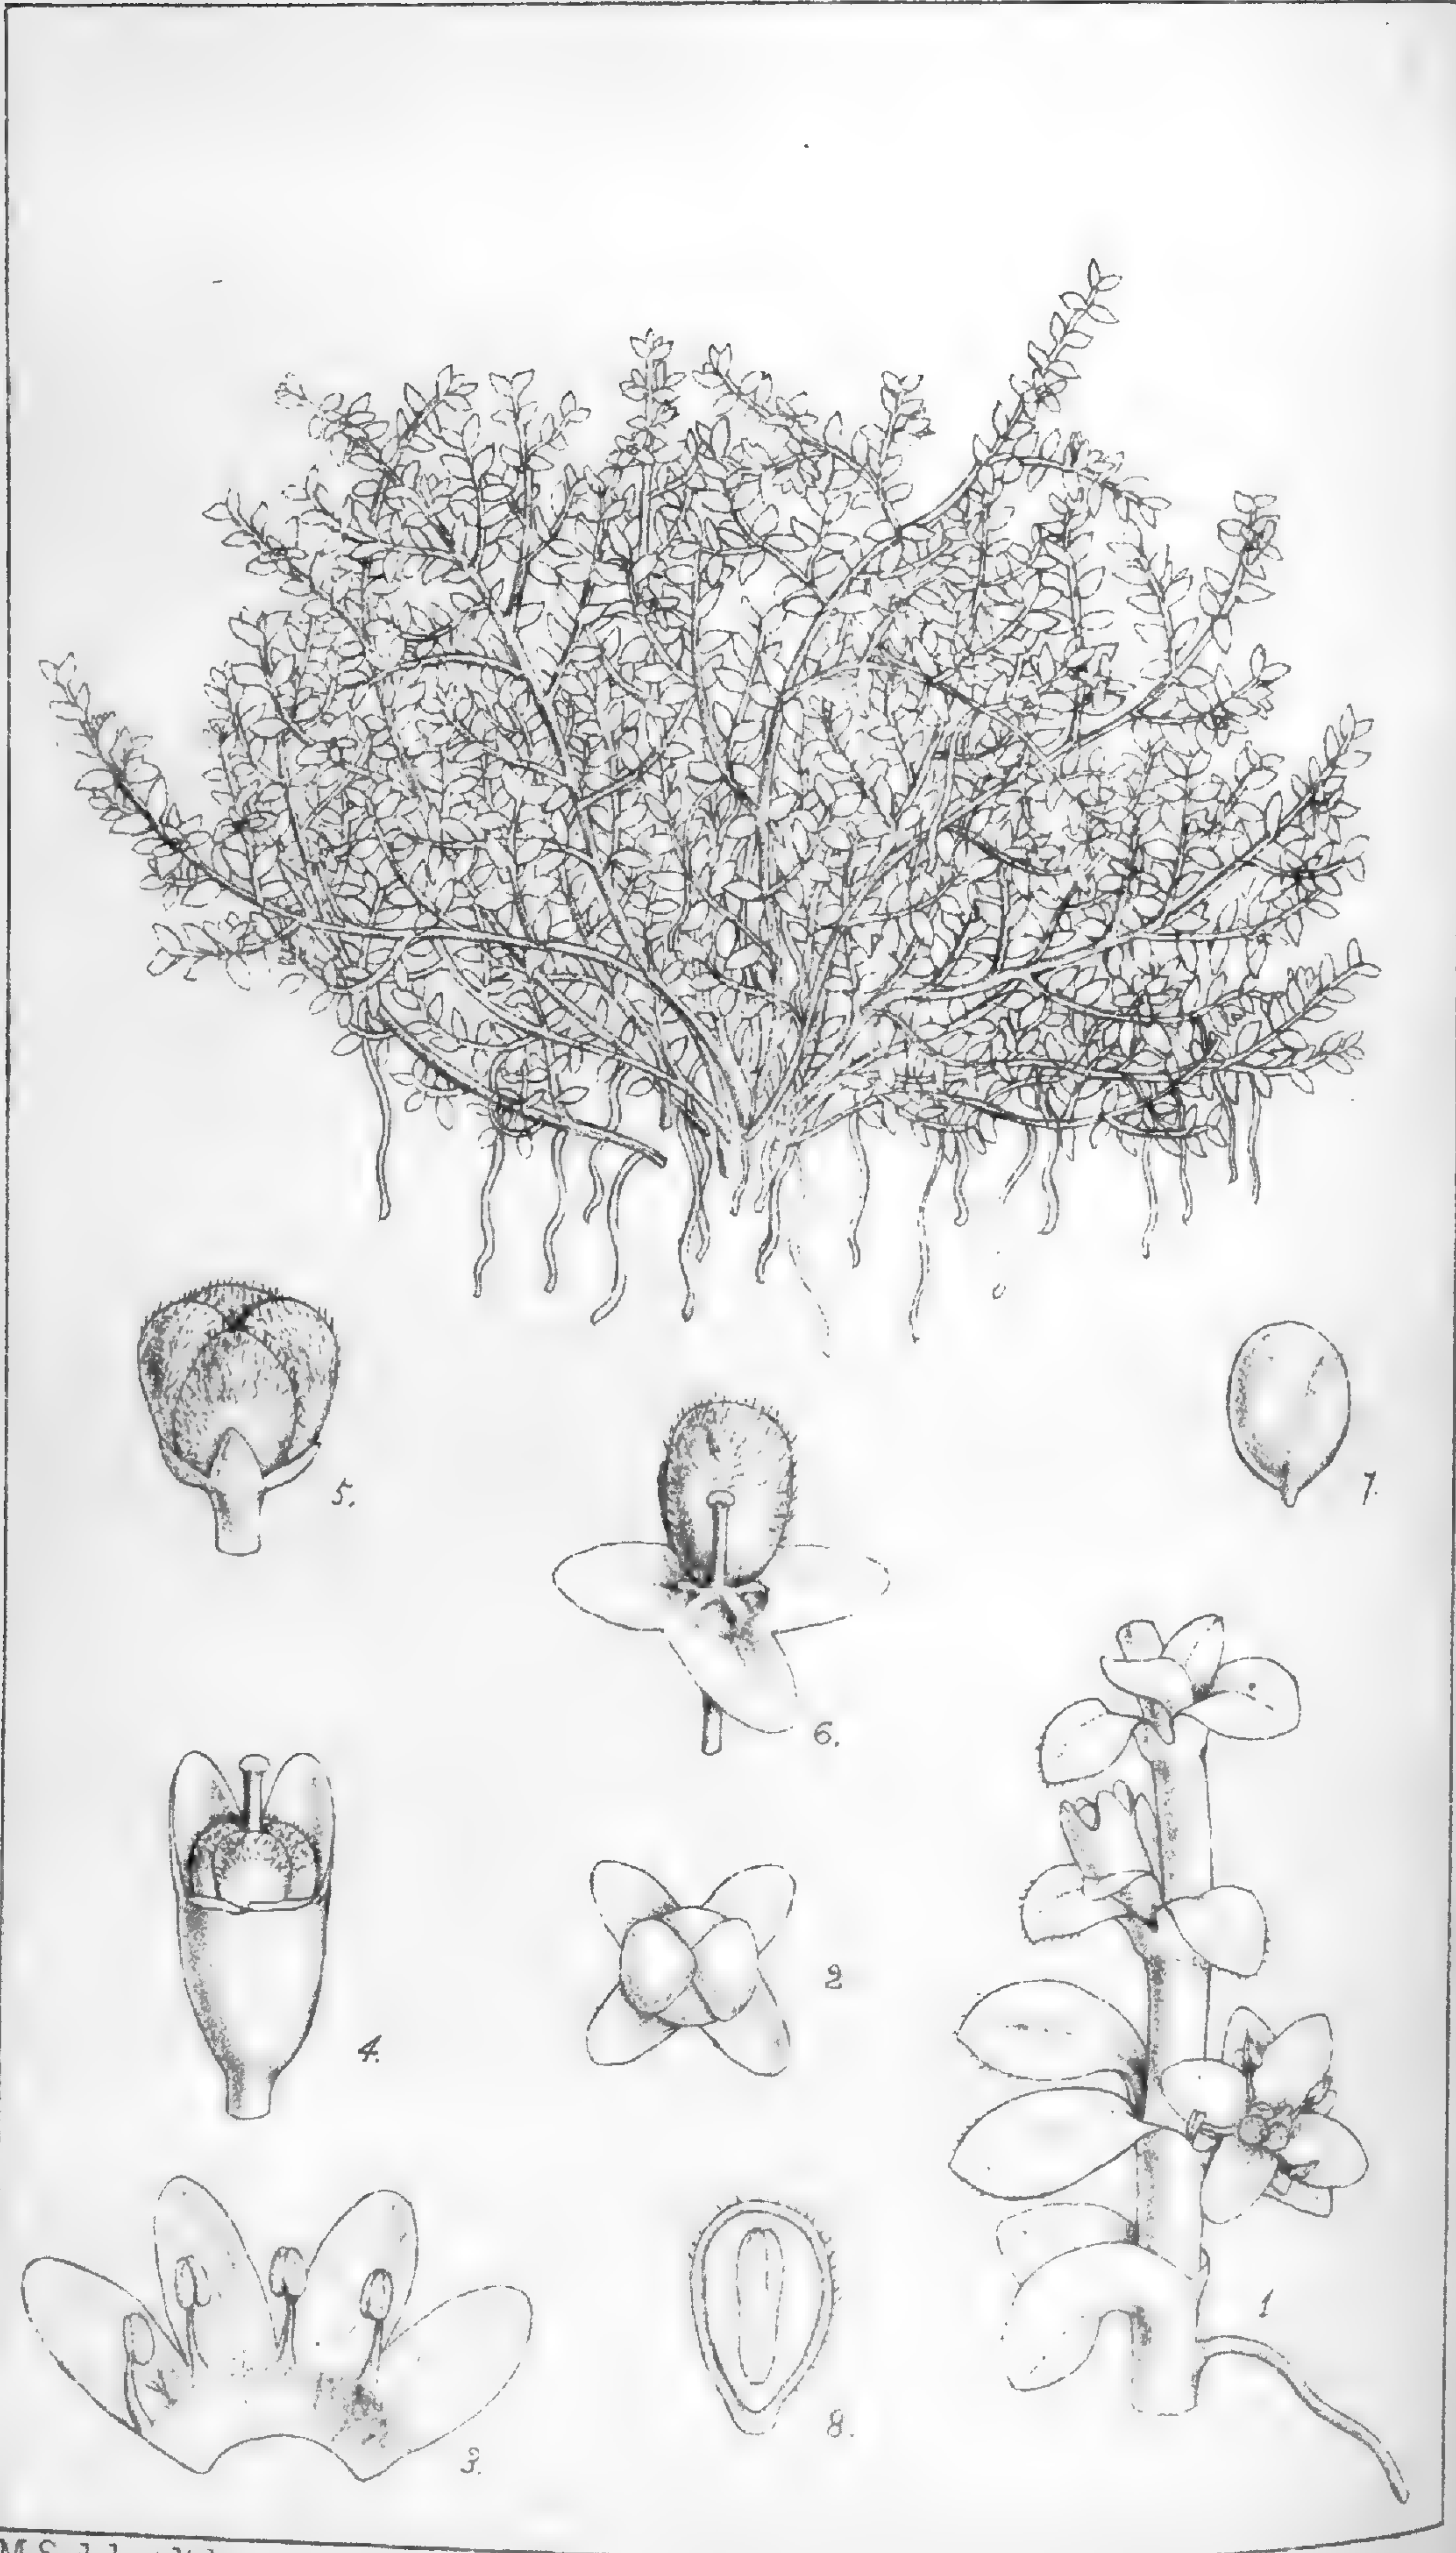

S. quinquenervia, *Duchassaing* in *Ann. Sc. Nat.*, sér. iv., xvii. 176 (*Planch. et Triana, Prodr. Fl. Novogranat.*); frutescens 7-9 ped. alta, ramis teretibus ferrugineo-setosis, foliis lanceolato- v. ovato-oblongis acuminatis serratis basi rotundatis utrinque stellato-hispidis, petiolo setoso lamina 6-10-plo brevior, stipulis subulatis sæpe 2-3-fidis, floribus subsessilibus in spicis axillaribus brevibus congestis v. in axillis superioribus longioribus sæpe interruptis dispositis, supremis in spicam simplicem v. parce ramosam confluentibus, bracteis bracteolisque 3-5-7 calyces superantibus anguste lineari-subulatis basi sæpius breviter coalitis, calycis dense setoso-hirsuti 5-fidi segmentis ovatis acutis, petalis setoso-unguiculatis cuneatis oblique et obtuse bilobatis, staminum tubo basi ovarium arcte cingente, ovario depresso globoso tomentello, stylis inferne coalitis c. 8 gracilibus. stigmatibus capitellatis, ovulo solitario pendulo, carpidiis maturis papyraceis dorso rotundatis tumidis inappendiculatis primum apice 'demum secus dorsum usque ad basin' dehiscentibus. *Sida guianensis*, *K. Schum. in Mart. Fl. Bras. xii., pars iii.* 305; *Sidastrum quinquenervium*, *E. G. Baker in Journ. Bot.*, 1892, 137.

HAB. Panama, *Duchassaing*; British Guiana, *Schomburgk* (Nos. 545, 863 B); French Guiana, *Poiteau*; Brazil, Registro of S. João da Araguay, *Burchell* (No. 9,102), *Glaziou* (No. 10,279).

Folia 4-7 poll. longa, $1\frac{1}{3}$ - $2\frac{1}{2}$ poll. lata; *petiolus* $\frac{1}{3}$ -1. poll. longus. *Flores* $\frac{1}{3}$ - $\frac{1}{2}$ poll. lati, aurei. *Carpidia* matura 1 lin. longa atque lata.

This plant I had sorted into *Malvastrum* in provisionally working up the Burchell Herbarium. Mr. Edmund Baker, in his revision of the Malvæ for his 'Synopsis,' now in course of publication, recognised the probable identity of the Brazilian plant with that from Panama collected by Duchassaing, and established upon it a new genus intermediate between *Sida* and *Malvastrum*. On comparing our specimens, however, with the description of *Sida guianensis* of Dr. Schumann, I suspected the identity of *Sidastrum* with that plant, and find this confirmed by inspection of Glaziou's specimen cited by Dr. S., which apparently had not been accessible to Mr. Baker. I think it prudent to leave it in *Sida*. I need not here enter upon the morphological value of the subulate 'bracts and bracteoles' associated with the congested flowers. The coherent 'bracteoles' very probably are the equivalents of the often 2- or 3-fid stipules.—D. OLIVER.

Folia omnia opposita parva* $\frac{1}{2}$ — $\frac{1}{6}$ poll. longa, elliptica, obtusa v. obtusiuscula, integra, carnosula, obscure punctata; petioli latiusculi, plani, interdum parce setuloso-ciliolati, connati. *Flores ramulos breves axillares foliiferos terminantes, sæpius solitarii.*

T. Hamiltonii, *Petrie in Herb. Kew. (sp. unica).* *Tillæa Hamiltonii*, *T. Kirk ex Hamilton in Trans. N. Z. Inst. xvii. (1884) 292.*

HAB. New Zealand, South Island; Lowlands of Southern Otago, Waipahi, *D. Petrie*; flats and river-bed of the Makarewa (or Mangarewa), *T. Kirk.*

A very remarkable little plant of doubtful immediate affinity, occurring, according to Mr. W. S. Hamilton (*l. c.*), with *Tillæa*, for which it is, at first sight, most readily mistaken, and other aquatic or semi-aquatic growths, with which it 'carpets the river-bottom to a very considerable depth.' The leaves are strictly opposite, the petioles being, indeed, connate, and the seeds contain a copious albumen, which is wanting in *Boragææ* proper. I have been unable to satisfy myself entirely as to the æstivation, farther than that it appears to be imbricate, though in what sequence in the segments I am unable to say.—D. OLIVER.

Fig. 1. Fragment of flowering branch enlarged. 2. Bud from above, showing imbrication of corolla-lobes. 3. Corolla laid open. 4. Flower, the corolla and front-lobes of calyx removed. 5. Fruit. 6. Same, three of the nuts removed. 7. Detached nut, inner face. 8. Longitudinal section of seed, showing embryo. *All enlarged.*

Braya uniflora, Hk. f. & Thom.

PLATE 2251.

BRAYA UNIFLORA, *Hook. f. et Thom.*

CRUCIFERÆ. Tribe CAMELINEÆ.

B. uniflora, *Hook. fil. & Thoms. in Journ. Linn. Soc. v. 168*; humilis, dense cæspitosa, glaberrima, collibus crassis petiolorum vaginis albidis arcte vestitis, foliis lineari-spathulatis obtusis integerimis carnosus planiusculis, scapis unifloris sæpius folio brevioribus, sepalis interdum fere ad apicem v. inæqualiter cohærentibus basi subæqualibus oblongo-ellipticis obtusis marginibus hyalinis, petalis unguiculatis, lamina obovato-rotundata alba, ovario leviter compresso tetragono, ovulis in utroque loculo c. 5–6, siliquis (*in spp. Thomsonianis*) linearibus compressiusculis, suturis longitudinaliter sulcatis, valvis carnosulis, septo completo, seminibus c. 10 uniseriatis ellipsoideis leviter compressis.

HAB. Western Tibet, Nubra, 15,000–17,000 feet, *Thomson*; Yarkand Expedition, *Henderson*; Tibet, 17,000 feet, in ‘sandy gravelly soil,’ *Thorold*.

Folia pollicaria. *Siliquæ* 4–6 lin. longæ.

This curious little plant, of which a good flowering specimen has recently been communicated to the Kew Herbarium by Surgeon-Captain W. G. Thorold, is the only member of the large and familiar Order Cruciferæ—so far, at least, as my experience goes—in which we have true cohesion of the sepals. The cohesion is not always equal all round, it is true, but it is singular that in an Order of considerably over one thousand species, in a very large number of which the sepals are erect and closely applied in their imbricate æstivation, a tendency to a gamosepalous calyx should not be more frequent. —

Bambusa Wrayi, Stapf.

BAMBUSA WRAYI, Stapf.

GRAMINEÆ. Subtribe EUBAMBUSEÆ.

Bambusa Wrayi, Stapf in *Kew Bulletin*, 1893, 14; culmo peralto, valde nutante gracili, panícula maxime decomposita, spiculis fertilibus paucis, glumis gradatim incrementibus, infimis 2 vacuis, sequentibus 2-3 plerumque gemmiparis, gl florifera rachilla tenui elongata gemmulam rudimentariam gerente æquilonga vel subæqui-longa, ovario oblongo sensim in stylum brevem attenuato, stigmatibus 3 tenuibus longis.

HAB. Perak in monte Gunong Inas ad fontes fluminum Selama et Plus River, 4,500-5,500 ped. alt., L. Wray, jun. (Herb. Mus. Perak. No 4,166).

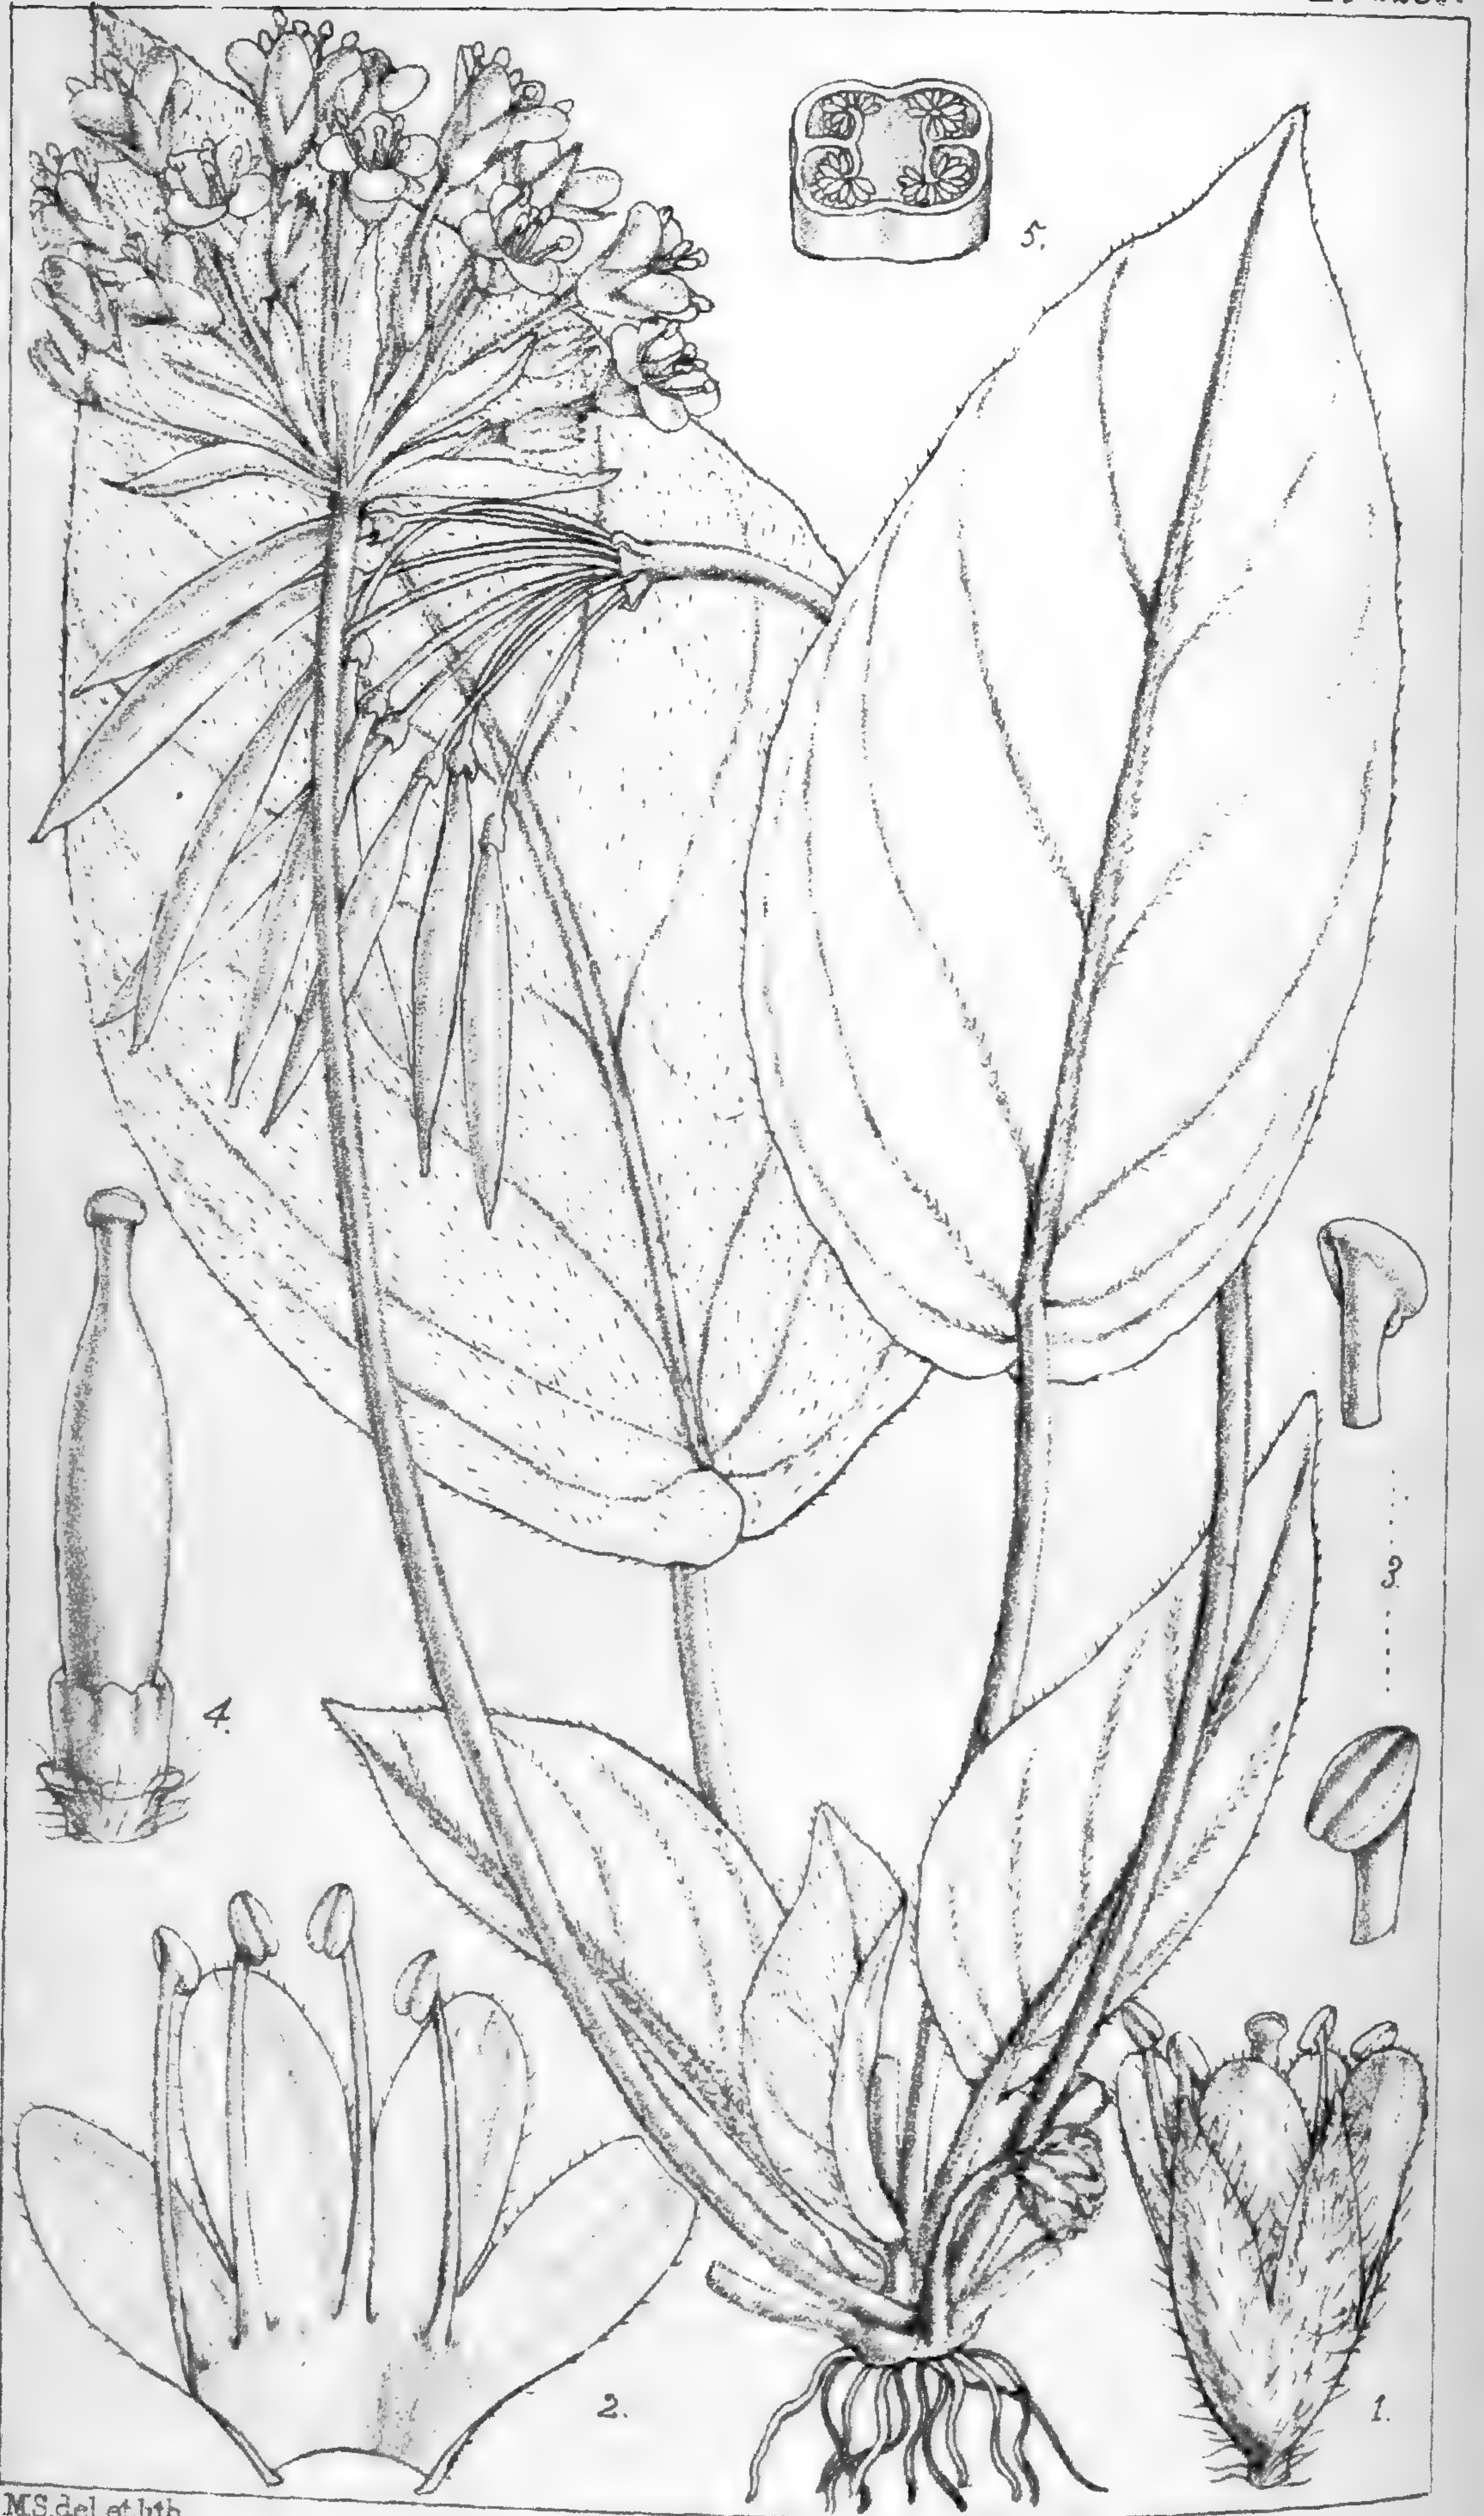

Culmus 40-60 ped. altus, basi circa 1 poll. crassus superne tenuis-simus nutans apice ad solum usque flexus inermis, internodiis flavidis glabris nitidis teretibus fistulosis, tertio vel quarto supra basin long-issimo interdum ad 7 ped. longo. *Folia* lineari-lanceolata longe et angustissime acuminata basi rotundata, 8-10 poll. longa 10-13 lin. lata, lævia, glabra, nervis secundariis utrinque 7-8, vaginis striatis pallidis glabris, ligula truncata brevi pilis 3-6 lin. longis deciduis ciliata. *Panicula* nuda vel apicem versus foliosa, a basi ramo-sissima, ramis vel abbreviatis verticillatim seu subverticillatim arcte congestis, vel elongatis, plerumque 5-8 poll., interdum vero ultra 3 ped. longis, striatis. *Spiculæ* laxius dissitæ vel sæpius fasciculatim congestæ, 6-9 lin. longæ. *Glumæ* infimæ ovatæ, intermediæ et superiores lanceolatæ, acuminatæ, tenuiter coriaceæ, opacæ, ad $4\frac{1}{2}$ lin. longæ, marginibus ciliatæ. *Palea* submembranacea gluma sua paulo brevior, superne quidem bicarinata, in carinis asperula vel ciliata, in sulco dorsali rachillam rudimentumque fovens. *Lodiculæ* obovatæ vel ellipticæ, ciliatæ, subæquales. *Antheræ* 6 glabræ, muticæ. *Ovarium* vix 1 lin. longum; stylus $\frac{1}{2}$ lin. longus stigmatibus 3 plumosis 3-plo vel 4-plo longioribus. *Caryopsis* (immatura) e basi oblonga in rostrum brevem cylindricum attenuata.

B. Wrayi is closely allied to *B. Griffithiana*, Munro, and, like this, to *Nastus*, as far as the composition of the spicula is concerned. The only essential difference is in the presence of "gemmae" or sterile spiculæ in the axils of the glumes which immediately precede the flowering one. I am therefore of opinion that *Nastus* should be brought as a section or subgenus to *Bambusa*. There exists also a striking similarity, in the habit of loose and long-branched panicles, between *B. Wrayi* and *Melocanna virgata*, Munro, but the structure of the spikelet is quite different.

The Semangs call this bamboo *Buloh Versumpitan* and use the long internodes for their blowpipes. Some interesting particulars respecting this Bamboo and its uses are given in a letter from Mr. Wray to the Director of the Royal Gardens in the 'Kew Bulletin,' 1893, p. 16.

M.S. del, et lith.

Bournea sinensis, Oliv.

PLATE 2254.

BOURNEA SINENSIS, Oliv.

GESNERACEÆ. Subtribe DIDYMOCARPEÆ.

Bournea, Oliv. (gen. nov.). *Calyx* profunde 4-fidus; tubo campanulato, segmentis æqualibus lanceolatis v. lineari-lanceolatis corolla paullo brevioribus v. interdum subæquilongis. *Corolla* fere regularis profunde 4-fida; lobis adscendentibus æquilongis tubo paullo longioribus v. eodem subæquilongis. *Stamina* 4 lobis corollæ alterna, 2 v. 3 v. omnia demum plus minus exserta; antheræ liberæ distantes, oblongo-ellipticæ, dorsifixæ inappendiculatæ; filamenta anguste linearia glabra sub sinibus corollæ inserta. *Discus* campanulato-tubulosus integer ovarii basin cingens. *Ovarium* anguste lineari-oblongum apice in stylum brevem angustatum, stigmate obtuso bilobulato; placentæ intrusæ bifidæ, laminis ovuliferis recurvis. *Capsula* linearis apice acuminata ad basin gradatim angustata, loculicide dehiscens, valvis medio placentiferis haud tortis. *Semina*—Herba acaulis, foliis longe petiolatis ovato-ellipticis, breviter acuminatis integris basi rotundatis anguste cordatis auriculis brevibus obtusis superpositis, supra læte viridibus, sparse et adpresse setuloso-pilosis, subtus præcipue in costa nervisque parce adpresse setulosis. Scapi patentim ferrugineo-pilosi apice umbellatim multiflori folia minora superantes; umbellæ involucriatæ 15–30-floræ bracteæ herbacæe lineari-lanceolatæ pedicellis pilosis sæpius breviores.

B. sinensis, Oliv. (sp. unica).

HAB. China, Prov. Kwangtung, in the Lo-fan Mountains, 3,000 feet, Bourne and Atkinson's Native Collector; com. C. Ford (No. 324).

Folia majora 4–5½ poll. longa, 2–3 poll. lata; petiolus 1½–5 poll. longus, plus minus adpresse setuloso-hirtus. *Scapus* 4–7 poll. longus. *Flores* 5–6 lin. longi. *Capsula* 1–1¼ poll. longa.

One habitually feels averse to the multiplication of monotypic generic forms of Cyrtandreae, of which several have reached us of recent years from China, but I believe no other course is open under existing taxonomics of the Tribe. The nearest affinity of *Bournea* would seem to be with *Oreocharis*, from which it differs in the tetramerous calyx, the 4-lobed corolla (of which one segment—I presume, the posterior—is but very slightly broader than the rest), and the relatively very short tube of the corolla as compared with its limb; the entire corolla indeed is shorter, or scarcely longer, than the calyx. The foliage somewhat resembles that of *Chirita eburnea*, Hance. Unfortunately, no seeds are left in the capsules of a previous year which remain attached to the specimen. The generic name commemorates, at Mr. Ford's request, the services rendered to botany by Mr. F. S. A. Bourne, H.B.M. Vice-Consul at Canton, to whom the Kew Herbarium is indebted for various valuable communications.—D. OLIVER.

M. S. del. et lith.

Tretocarya sikkimensis, Oliv

PLATE 2255.

TRETOCARYA SIKKIMENSIS, *Oliv.*

BORAGINEÆ. Subtribe ERITRICHIEÆ.

T. sikkimensis, *Oliver*; herba ramosa setosa 2-3-pedalis, foliis caulinis ovato-lanceolatis acutis basi in petiolum angustatis, cymis congestis bracteatis terminalibus et in axillis foliorum pedunculatis v.-superioribus sessilibus, floribus brevissime pedicellatis v. sessilibus, calycis segmentis lanceolatis setosis fructiferis leviter accrescentibus, corollæ rotatæ tubo calyce subduplo longiore fauce squamis brevibus late rotundatis instructo, segmentis limbi rotundatis integris, antheris apicibus leviter exsertis ovali-oblongis inappendiculatis, nuculis gynobasi pyramidatæ medio areola parva immarginata affixis rhomboideo-ovoideis, dorso convexo medio fovea parva oblonga quasi perforatis leviter tuberculatis apice productis acutiusculis basi liberis rotundatis. *Anchusa sikkimensis*, *Clarke in Hook. Fl. Brit. Ind.* iv. 168.

HAB. Sikkim Himalaya, Latong, 11,500 feet, *Hooker*; in a collection from West Szechuan and Tibetan frontier, chiefly near Tachienlu, 9,000-13,500 feet, *Pratt* (No. 645).

Folia caulina inferiora longe petiolata, lamina 2-2½ poll. longa, 1 poll. lata; folia superiora minora; petiolus 1-2 poll. longus; omnia plus minus setoso-scabra. *Flores* ¼-½ poll. diam. *Nuculæ* 1 lin. longæ, facie supra areolam carinatæ.

Notwithstanding the remarkable difference in habit from the acaulescent monotypic *Tretocarya* of Maximowicz, I prefer to place this plant under that genus, with which, so far as I have ascertained, the structure of the flower and fruit is in satisfactory agreement, rather than under *Anchusa*, to which genus it is referred by Mr. Clarke (*l.c.*), though with hesitation, and the remark confirmatory of the course here taken, that 'the nutlets are exceedingly like those of *Microula* and do not agree well with those of *Anchusa*.' Our figure is from Mr. Pratt's specimen, in which I find quite mature nuts, which were wanting in the Sikkim specimens at Mr. Clarke's disposal. *Microula* is the genus most nearly allied to *Tretocarya*, so far as I can see, the latter only differing in the dorsal *fovea* of the nuts. Our plant a little resembles *Omphalodes trichocarpa*, Max., in habit.—D. OLIVER.

Fig. 1. Fl. w. 2. Calyx. 3. Corolla laid open. 4. Nut showing dorsal areole. 5. Same, inner face, showing hilum. *All enlarged.*

M.S. del, et lith.

Actinocarya tibetica, C. B. Clarke.

PLATE 2256.

ACTINOCARYA TIBETICA, C. B. Clarke.

BORAGINEÆ. Subtribe CYNOGLOSSEÆ.

A. tibetica, C. B. Clarke in *Hook. Fl. Brit. Ind.* iv. 155; herba gracilis diffusa sparse strigillosa v. glabrata, foliis oblanceolatis spathulatisve obtusis, floribus minimis graciliter pedicellatis, pedicellis insertione bracteæ foliaceæ arcte approximatis, calycis 5-partiti segmentis oblongo-lanceolatis acutiusculis setuloso-ciliolatis, corollæ rotatæ tubo calyce brevioris campanulato, ore leviter constricto squamis brevibus obtusis emarginatis instructo, limbi lobis rotundatis integris, antheris parvis inclusis ellipticis inappendiculatis medio tubi insertis, stylo ovarium superante stigmatibus capitellatis, nuculis radiatim patentibus hilo minuto, hispidulo-scabridis et glochidiis sparsis stipitatis armatis, facie superiore cyatho cartilagineo glochidiis marginato ornatis.

HAB. Western Tibet; Nubra, near Karsar, 13,000 feet, Thomson.

Folia basi gradatim angustata, inferiora et radicalia longiuscule petiolata; lamina $\frac{1}{2}$ –1 poll. longa. *Pedicelli* $\frac{1}{2}$ – $\frac{1}{4}$ poll. longi. *Flores* $\frac{1}{8}$ – $\frac{1}{6}$ poll. diam.

A curious little plant, of which we only possess Dr. Thomson's original specimens, allied to *Omphalodes* and *Thyrocarpus*, but different in the abrupt insertion of the glochidiate-margined cyathus on the face of the nuts, but more especially in the narrow attachment and radial disposition of the latter. In the 'Genera Plantarum' I observe the glochidia are described as 'sparsis v. nonnullis basi connexis, vix tamen cyathum formantibus,' while in the 'Flora of Brit. India' Mr. Clarke makes no reference to a cyathiform appendage. In ripe nuts, however, it is conspicuous and as here figured.—D. OLIVER.

Fig. 1. Flower. 2. Calyx laid open, corolla removed. 3. Corolla laid open. 4. Fruit. 5. Nut detached and laid open. *All enlarged.*

M. S. del. et lith.

Microula Benthami, C.B. Clarke.

PLATE 2257.

MICROULA BENTHAMII, *C. B. Clarke.*

BORAGINEÆ. Subtribe ERITRICHIEÆ.

M. Benthamii, *C. B. Clarke in Hook. Fl. Brit. Ind.* iv. 167; herba acaulis v. nonnunquam ramulos laterales breves emittens, foliis rosulatis patentibus ovali- v. spathulato-oblongis basi angustatis v. distincte petiolatis obtusis setoso-dentatis v. repando-serratis scabride hispidis et parce setosis setis tuberculo insidentibus, cymis contractis, pedunculis crassis brevibus folio multo brevioribus bracteatis iteratim divisis, bracteis foliaceis margine setosis inferioribus flores superantibus, floribus sessilibus v. brevissime pedicellatis, calycis temp. florif. 5-fidi tubo campanulato-turbinato glabro v. parce setoso, lobis ovato-oblongis dorso setulosis, corollæ rotatæ tubo calycem æquante lobis rotundatis fauce squamis 5 obtusis retusisve instructo, ovarii lobis 4 distinctis lateraliter compressis areola gynobasi subplanæ insertis, nuculis ovoideis v. rhomboideo-ovoideis obtuse angulatis plus minus tuberculatis, tuberculis cum setis brevissimis recurvis glochidiatis coronatis.

HAB. Tibet, 15,000–18,000 feet, *Thomson; Strachey and Winterbottom, Thorold.*

Radix simplex v. parce ramosa recta elongata. *Folia* majora 1–3 poll. longa, $\frac{1}{2}$ – $\frac{3}{4}$ poll. lata. *Flores* $\frac{1}{8}$ poll. diam. *Bracteæ* ultimæ oblongæ v. lineari-oblongæ setulosæ floribus breviores. *Antheræ* tubo corollæ insertæ, elliptico-oblongæ; filamentum breve. *Stylus* temp. florif. ovarium superans (2–3-plo longior); stigma parvum truncatum subcapitellatum.

The genus *Tretocarya* of Maximowicz (*Mél. Biol.* xi.; *Diag. Plant. Nov. Asiaticarum* iv. 270 (1881)), of which we possess specimens collected by M. Przewalski in Northern Tibet, singularly resembles the above plant in almost every particular. But I find no trace, on the back of the nucules of *Microula*, of the 'fovea parva immarginata' characteristic of those of *Tretocarya*. In the absence of fairly mature fruit it must be almost impossible to decide to which genus a specimen should be referred. Although I have no explanation to offer of the alleged difference in respect of this character of the nuts, one can hardly help suspecting that *Tretocarya* may prove to be a form of the plant here figured.—D. OLIVER.

Fig. 1. Flower. 2. Calyx. 3. Corolla, laid open. 4. Pistil. 5. Nut, back and front view. 6. Same, laid open. *All enlarged.*

Bromelia argentea, Baker.

PLATE 2258.

BROMELIA ARGENTINA, *Baker*.

BROMELIACEÆ. Tribe BROMELIÆ.

B. argentina, *Baker in Kew Bulletin*, 1892, p. 194; *terrestris*, *acaulescens*, foliis (5-pedalibus) super vaginam haud constrictis sed ad apicem gradatim angustatis, margine aculeis validis rigidis basi subito dilatatis a basi sursum versus uncinatis armato, inflorescentia dense paniculata oblonga pedunculata, pedunculo bracteis imbricatis ovato-lanceolatis scariosis obtecto, bracteis inflorescentiæ primariis ovatis dentatis in apicem anguste lanceolatam rubro-coloratam subito contractis, bracteis floriferis oblongis acute carinatis denticulatis v. integris, ovario oblongo trigono tomentoso, sepalis oblongis obtusis, petalis rubris lingulatis sepala paullo superantibus, staminibus styloque petalis brevioribus, bacca oblonga coriacea.

HAB. South America: Argentine Republic, *F. E. Harman*; Paraguay, *Dr. W. Stewart*.

Folia super vaginam $1\frac{1}{2}$ poll. lata. *Inflorescentia* $\frac{1}{2}$ -pedalis; pedunculus subpedalis validus bracteatus; bracteæ floriferæ $1\frac{1}{2}$ poll. longæ. *Ovarium* 1 poll. longum, $\frac{1}{3}$ poll. diam. *Sepala* pollicaria. *Bacca* (exsicc.) $1\frac{1}{2}$ poll. longa.

As explained in the 'Kew Bulletin' cited above, the original description of *Bromelia argentina* in my 'Handbook of the Bromeliaceæ' was vitiated by the leaves, sent with the inflorescence of the true plant, proving to belong to a different species. We are indebted to Dr. Stewart, H.B.M. Consul at Ascension, for the excellent and complete specimens which enable us to give the accompanying figure and corrected description.

The aculei of the median portion of the leaf are about one inch apart, laterally directed towards the apex, but occasionally a few are retrorse.

The importance of this species from an economic point of view, as affording the 'Caraguata fibre,' is pointed out in the number of the 'Kew Bulletin' above referred to. Its nearest ally would appear to be *Bromelia Regnellii*, Mez in Martius, 'Fl. Bras.' (Bromeliaceæ, p. 194, tab. 53).—J. G. BAKER.

Fig. 1. Detached flower and bract. 2. Flower, the perianth-segments in front removed. *Slightly enlarged*.

A. *Hypoxis curculigoides*, Bolus.
 B. _____ *Schlechteri*, Bolus.

M.S. del, et lith.

PLATE 2259.

A.—HYPOXIS CURCULIGOIDES, *Bolus*.

B.—HYPOXIS SCHLECHTERI, *Bolus*.

AMARYLLIDÆ. Tribe HYPOXIDÆ.

A.—*H. curculigoides*, *Bolus* (*nov. sp.*); tota glabra, gracilis, 3–4 poll. alta; cormo depresso-conico vel sub-discoideo margine acuta membrana lævi vestito basi applanato fibris paucis coronato, vagina basali elongata, foliis sæpius 2 rarius 3 linearibus, facie canaliculatis acutis flore brevioribus, pedunculo gracili sæpissime unifloro bractea vaginante acuta prædito, perianthii segmentis oblongis vel lanceolatis acutis supra flavis subtus viridibus, antheris linearibus flavis segmentis perianthii brevioribus, stigmatibus oblongis antheris duplo brevioribus, ovario oblongo-clavato.

HAB. Sandy heathy flats, Kenilworth, near Cape Town, April–May (after the first winter rains), *R. Schlechter* (No. 627).

Folia 3–7 cm. longa. *Perianthii limbus* 1.2–1.8 cm. longus.

This species may possibly have been hitherto regarded as a var. of *H. stellata*, L., and I know of no other with which it can be confused. I am indebted to Mr. Schlechter for pointing out to me its differences from that species. The corm of the latter is usually—and I suppose, invariably—globose. It is so described by Baker ('*Journ. Linn. Soc.*' xvii. p. 101); it is so in the specimens in my herbarium; and though it is differently represented in some of the older figures published under the name of *H. stellata*, I do not suppose that it can really be variable to so great an extent. The leaves and flowers of this plant are smaller and fewer (the latter strikingly resembling in shape and colour those of *Curculigo plicata*), the habit is somewhat different, and, finally, while this plant flowers in April and May, *H. stellata* does not appear until July and August.—H. BOLUS.

A.—*H. CURCULIGOIDES*. Fig. 1. Corm. 2. Same, longitudinal section. 3. Transverse section of leaf. 4–5. Perianth-segments. 6. Flower, the perianth-segments removed. 7. Longitudinal section of ovary. *Except figs. 1 and 2, enlarged.*

Scottellia leonensis, Oliv.

PLATE 2265.

SCOTTELLIA, Oliv.

BIXINEÆ.

Scottellia, Oliv. (nov. gen.). *Sepala* 5 libera, imbricata, glabra, fere æquilonga v. exteriora paullo breviora, 3 exteriora cymbiformia elliptica, interiora late elliptica. *Petala* 5 imbricata, oblongo-elliptica v. ovato-lanceolata obtusa piloso-ciliata, intus basi squama crassiuscula obovato-cuneata facie interiore pilosa petalis multo breviora instructa. *Stamina* 5, hypogyna, petalis alterna libera, glabra; filamenta lineari-subulata apice attenuata anthera fere duplo longiora; antheræ ovato-ellipticæ basi bifidæ, connectivo latiusculo, locellis polliniferis marginaliter dehiscentibus. *Ovarium* glabrum obovoideo-ellipsoideum, basi leviter angustiore, 1-loculare, placentæ 3 multiovulatæ; stylus brevis breviter 3-fidus. *Fruct.* non vidi.—*Arbuscula* 15–20-pedalis, glabra. *Folia* late elliptica, integra, breviter obtuse apiculata basi late rotundata v. subcordata glabra coriacea venis primariis utrinque 6–9 subtus cum costa prominentibus; petiolus brevis crassiusculus. Flores in racemis axillaribus v. quasi terminalibus multifloris obsolete puberulis folio longioribus dispositi; bracteæ minutæ caducæ.

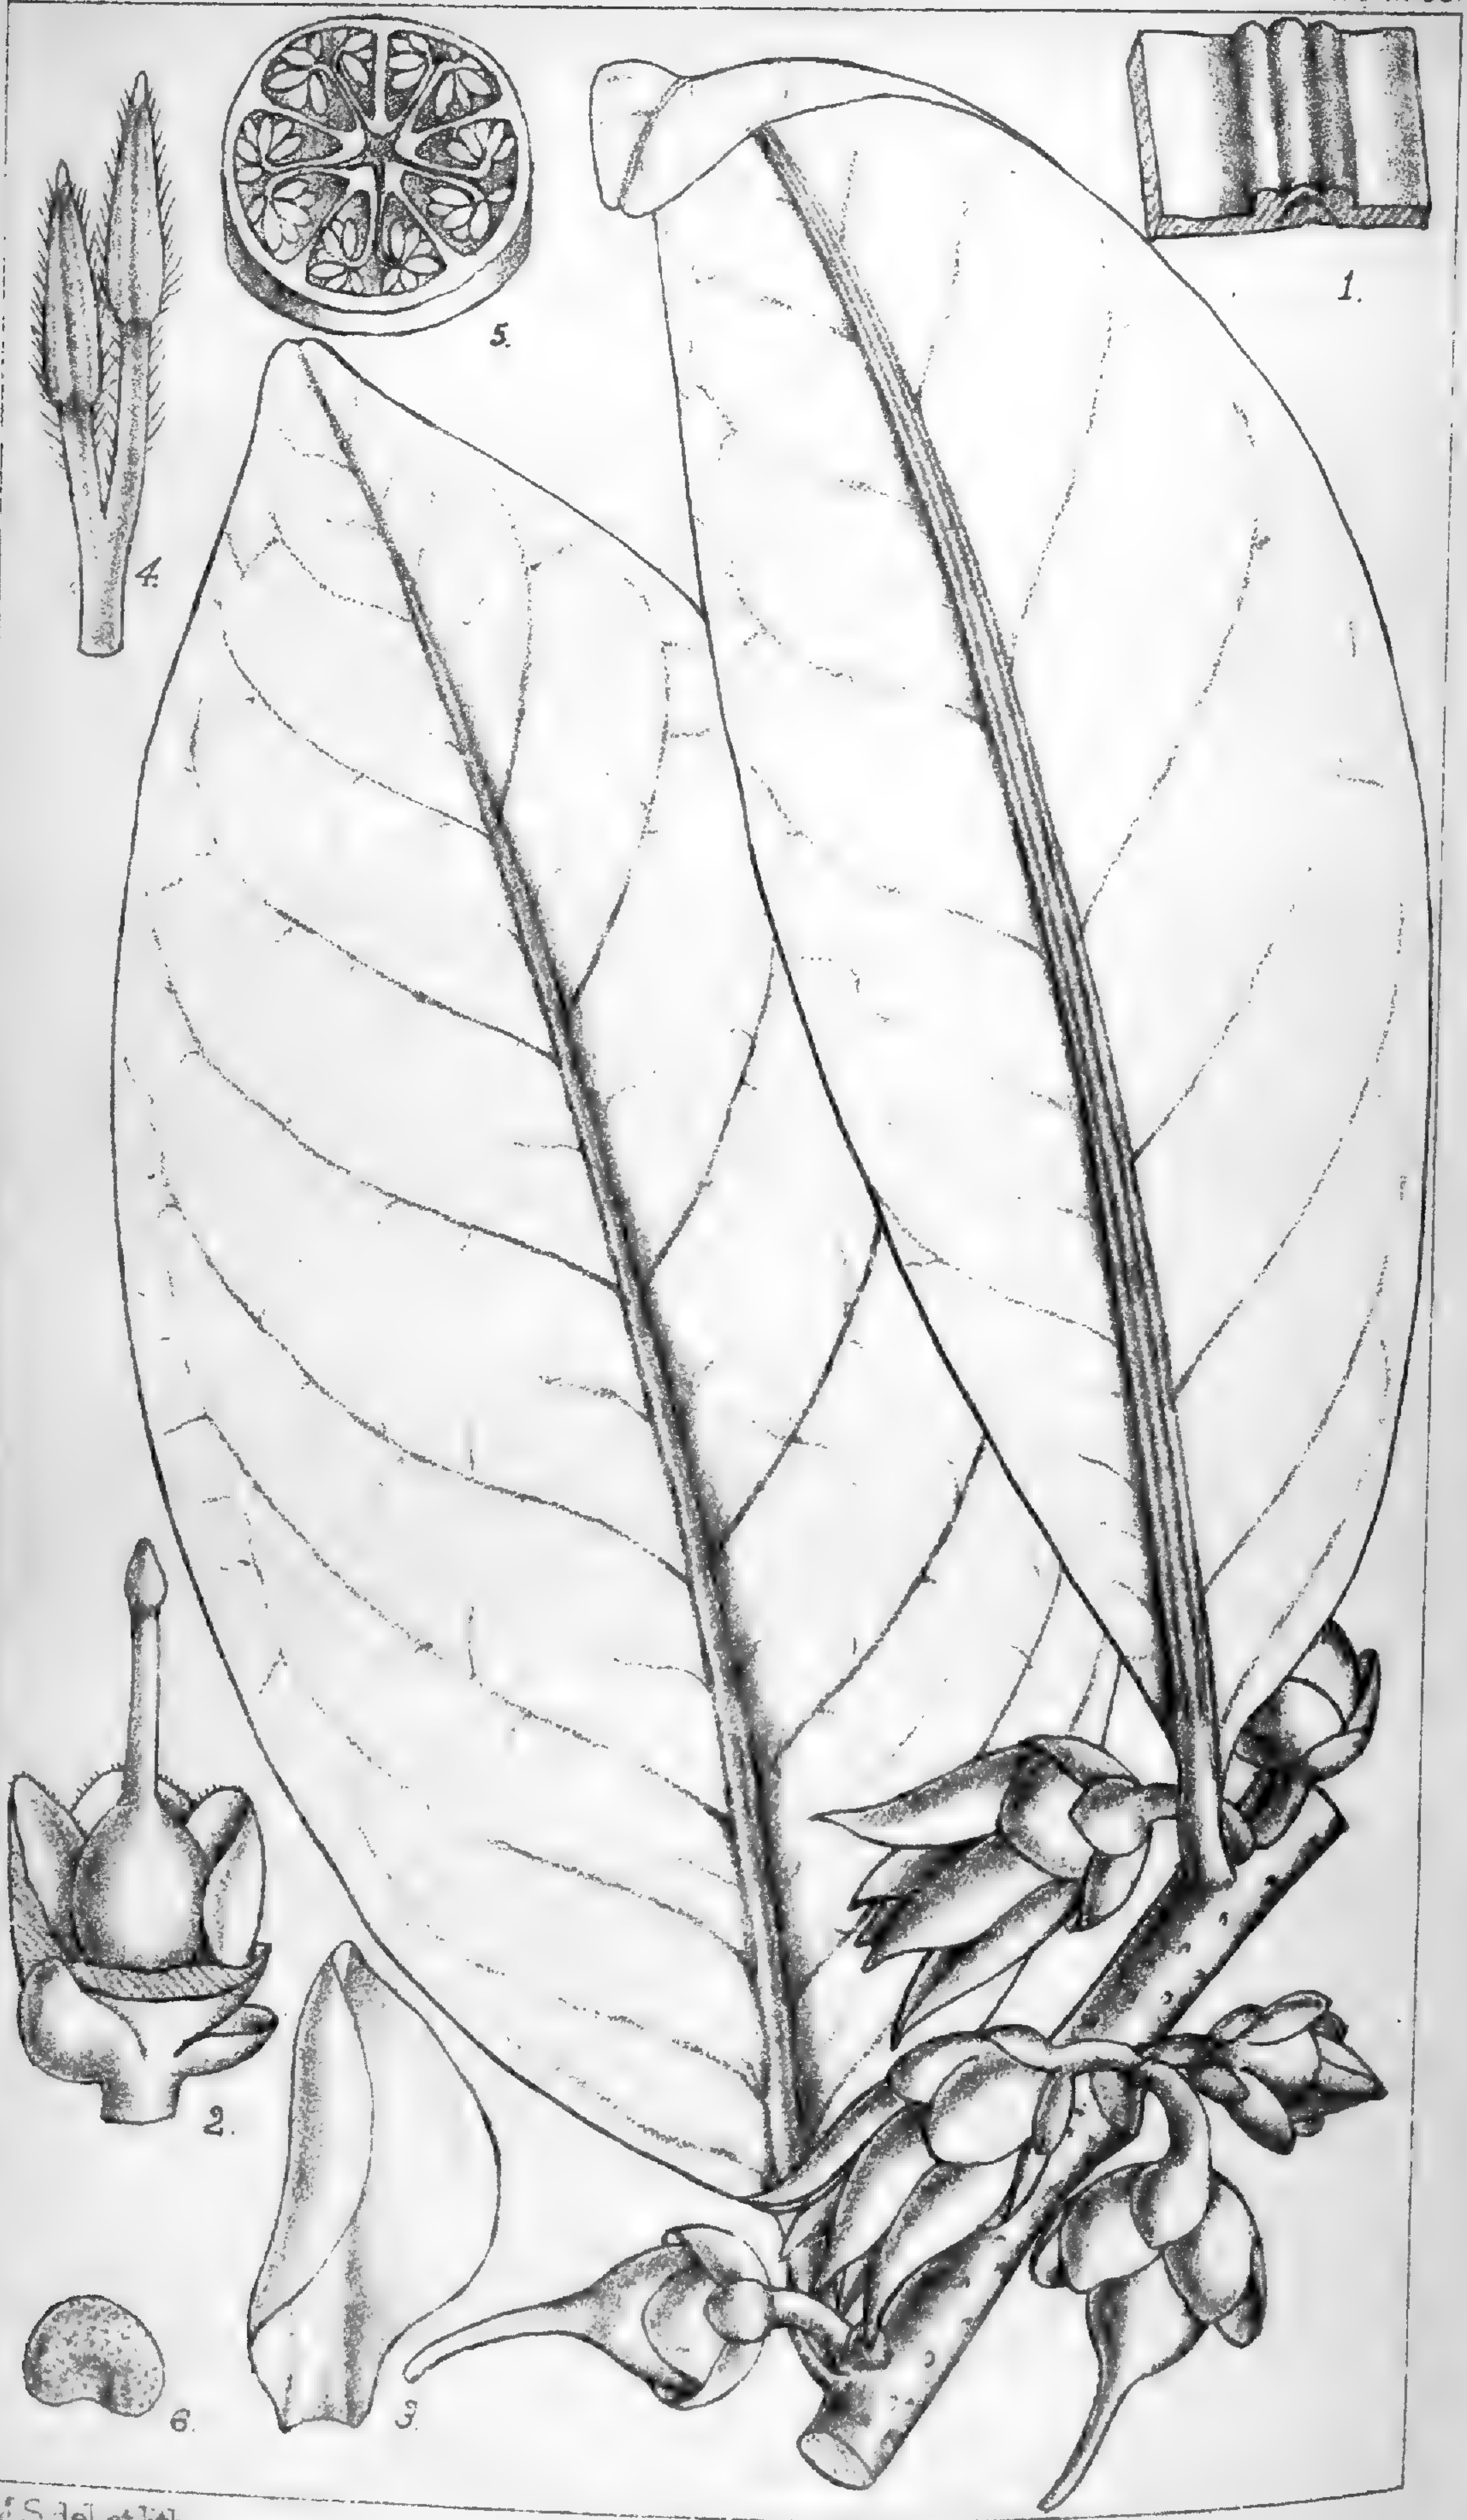

S. leonensis, Oliv. (sp. unica).

HAB. Collected on the Sierra Leone Boundary Commission, in the Samu Country, near Lusenya, G. F. Scott-Elliot.

Folia $4\frac{1}{2}$ – $5\frac{1}{2}$ poll. longa, $2\frac{1}{2}$ –3 poll. lata; petiolus $\frac{1}{10}$ – $\frac{1}{8}$ poll. longus. *Racemi* 5–9 poll. longi. *Flores* $\frac{1}{3}$ – $\frac{1}{2}$ poll. diam.; pedicelli $\frac{1}{8}$ – $\frac{1}{3}$ poll. longi.

The generic name is contrived to commemorate as euphoniously as may be the important botanical services of my friend Mr. G. F. Scott-Elliot, who accompanied the Anglo-French Delimitation Commission of Sierra Leone in the capacity of Naturalist, and who had previously explored little-known parts of South Madagascar as well as the Transvaal. *Scottellia* is clearly a close ally of my genus *Dasylepis*. I ('Journ. Linn. Soc.' ix. 170), in which the stamens are indefinite. I placed this latter genus in *Pangieæ*, but it may prove expedient to constitute a distinct subdivision of *Bixineæ* to include *Scottellia*, *Dasylepis*, and *Rawsonia*. Dr. Baillon, I observe, regards *Dasylepis* as not generically different from *Rawsonia* (*Dict. de Botanique*). I have not referred to stipules in the description; I think they have probably been present, but in our advanced specimen none remain, and the scars are obsolete.—D. OLIVER.

Fig. 1. Flower laid open. 2. Same, side view. 3. Detached petal, showing pilose adnate scale. 4. Anther, back and front view. 5. Pistil. 6. Transverse section of the ovary. All enlarged.

PLATE 2269.

SANSEVIERIA EHRENBURGII, *Schwef.*

HÆMODORACEÆ. Tribe OPHIOPOGONEÆ.

S. Ehrenbergii, *Schweinfurth in Herb. Nub. Exsicc.* (1865) No. 31; *Baker in Journ. Linn. Soc.* xiv. 549; foliis subcylindricis v. semicylindricis facie supra medium profunde sulcata infra medium planiuscula longitudinaliter sulcata marginibus acutiusculis plus minus prominentibus divaricatis, dorso rotundato leviter 5-7-canaliculato, foliis exterioribus parvis ovatis v. ovato-deltaideis apice longe cuspidatis, scapo foliis longiore, panicula ampla multiflora, floribus in racemis subaxis adscendentibus dispositis, pedicellis fasciculatis (3-6) apicem versus articulatis, perianthio albido pedicello 4-5-plo longiore, segmentis lineari-oblongis obtusis tubo gracili supra ovarium leviter constricto longioribus, staminibus perianthio æquilongis filamentis gracilibus antheris oblongis dorsifixis, stylo breviter exserto.—*S. Ehrenbergiana*, *Schwef. Piante utili dell' Eritrea*, 30.

HAB. Nubia and Italian territory west of the southern portion of the Red Sea, *Schweinfurth*; Yemen, widely spread in the lower region to the east of Hodeidah, *Schweinfurth*; Somali-land, *Stace*.

Folia longiora 4-5 ped. longa, medio $1\frac{1}{4}$ - $1\frac{1}{2}$ poll. crassa. *Flores* $\frac{2}{3}$ - $\frac{3}{4}$ poll. longi.

This plant was first published by Mr. Baker (*l.c.*), under the name given to it in Dr. Schweinfurth's herbarium, in 1875, his description being based upon a small specimen collected by that distinguished explorer of the Red Sea region. In the course of the current year the living plant has been received at Kew from Somali-land, through the good offices of Lieut.-Col. E. V. Stace, H.M. Consul on the Somali Coast; correspondence relative to which, and report upon the commercial value of its fibre, will be found in the 'Kew Bulletin,' 1892, 129. The Somali plant has not yet flowered, but I follow Dr. Schweinfurth, to whom sections of the leaf have been submitted, in referring it to *S. Ehrenbergii*. Our plate is chiefly based upon careful drawings supplied by Dr. Schweinfurth. We give representations also of transverse sections of the fresh leaf (from the Somali plant at Kew), which are those described above, as well as of the dried leaf, the latter copied from Dr. Schweinfurth.—D. OLIVER.

Fig. 1. Reduced view of entire plant. 2. Apex of leaf. 3. Transverse section of leaf, about 16 ins. from its base. 4 and 5. Transverse sections of dried leaf. 6 and 7. Passiflora Jenmani, M.T.M.

PASSIFLORA JENMANI, *Mast.*

PASSIFLORACEÆ. Tribe PASSIFLOREÆ.

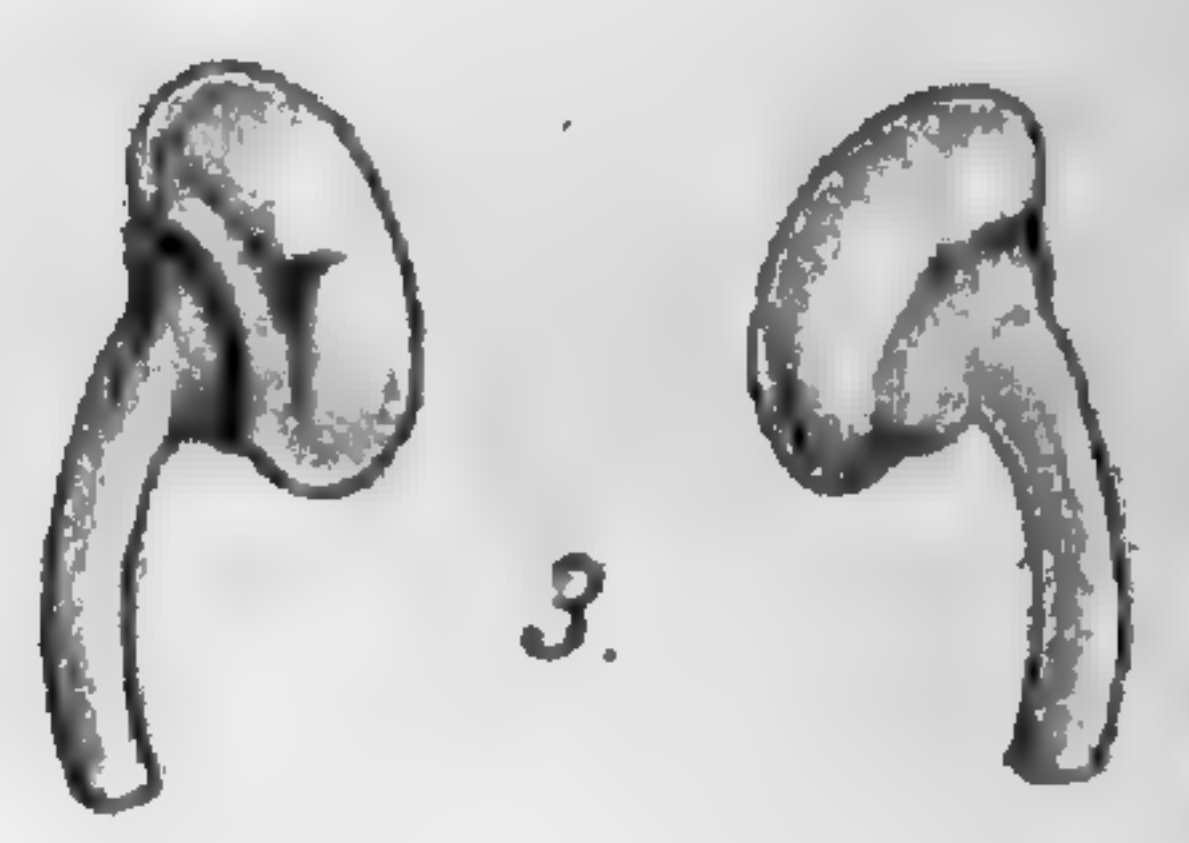

P. (§ *Decaloba*) **Jenmani**, *Mast.* (*sp. nov.*); ramulis teretibus puberulis, petiolis infra medium glandulis orbicularibus nigrescentibus sessilibus munitis, stipulis lineari-subulatis puberulis caducis, foliis pedatim 5-7-foliolatis, foliolo medio longiore, omnibus subcoriaceis oblongis acutis mucronatis basi in petiolulos breves angustatis, superne glabris, subtus puberulis, pedunculis brevibus cymosim 3-ramosis, ramis lateralibus floriferis, ramo centrali cirrhato, bracteis lineari-subulatis curvatis, floris tubo campanulato puberulo, intus glabro longitudinaliter sulcato, sepalis subcarnosis oblongis obtusis ecorniculatis, petalis sepalis æquilongis lineari- v. obovato-oblongis membranaceis 1-nerviis arcuatim venosis, corona filamentosa 3-seriali filis extimis petala æquantibus carnosulis apicem versus spathulatis petaloideo-dilatatis ad margines hyalino-denticulatis, filis inferioribus dimidio brevioribus apice capitatis rugosim lobulatis, corona membranacea ex ore tubi assurgente arcte plicata superne in lacinias membranaceas fimbriiferas divisa, corona inframediana et corona basilari deficientibus; gynophoro tereti basi incrassato ruguloso, superne glabro, andrœcio basi cupulato infra medium in filamenta dividente, ovario dense cano-tomentello ovoideo stipitulo puberulo insidente, stigmatibus majusculis subquadratis, fructu globoso extus coriaceo, seminibus obovoideis transversim rugulosis.

HAB. British Guiana, on the Mazaruni river; *Jenman* (No. 5,797).

Foliola majora 2-3 poll. longa, $\frac{3}{4}$ - $1\frac{1}{4}$ poll. lata; exteriora sæpius minora; petiolus 2- $2\frac{1}{2}$ poll. longus; petioluli $\frac{1}{6}$ - $\frac{1}{3}$ poll. longi. *Pedunculi* $\frac{1}{4}$ - $\frac{1}{2}$ poll. longi; pedicelli 1- $1\frac{1}{2}$ poll. longi. *Flores* diam. circa 2-3 poll.; *tubus calycinus* $\frac{1}{4}$ - $\frac{1}{3}$ poll., basi obtusus truncatusve. *Petala* pallide rubro-aurantiaca. *Fructus* magnitudine pruni *Armeniaccæ*. *Semina* $\frac{3}{10}$ poll. longa.

A remarkable species, technically belonging to the *Decaloba* section, but having more the appearance of a *Granadilla*. In its foliage it is unlike any other species except *P. pedata*, L., otherwise very different. *P. cirriflora* of Jussieu, according to the description, approximates in the character of the foliage, but Jussieu's plant is imperfectly known and may well be a *Modecca*. De Candolle's *P. septenata* is also doubtfully known, and may be the same as Jussieu's. Guiana is given as the habitat for both. It is noteworthy that there are now known several distinct species which are endemic in Guiana generally, but which have not, as yet, been found in the neighbouring countries.—
MAXWELL T. MASTERS.

Pauridiantha canthiifolia, Hk.f.

PLATE 2273.

PAURIDIANTHA CANTHIIFOLIA, *Hk. f.*

RUBIACEÆ. Tribe MUSSÆNDEÆ.

P. canthiifolia, *Hook. f. in Gen. Plant.* ii. 70; frutex ramulis gracilibus strigillosis, foliis oblongo-ellipticis petiolatis acuminatis basi angustatis, venis primariis utrinque 4-5 venulis transversis subparallelis glabris glabratisve costa subtus et venis primariis plus minus strigillosis hirtellisve, stipulis subulatis erectis rigidiusculis, cymis axillaribus sæpius 1 (-3)-floris breviter pedunculatis, pedicello bracteolato cum calyce parce strigilloso, calycis tubo breviter campanulato v. turbinato, limbo 4-5-fido tubo subæquilongo lobis ovato-deltaideis, corollæ rubescentis calyce 2-plo longioris lobis ovato-lanceolatis patentibus recurvisve æstivatione valvatis tubo æquilongis, staminibus fauce hirsuto insertis, filamentis brevibus, antheris parvis ellipticis dorsifixis minute apiculatis, stylo erecto calycis limbum superante apice breviter obtuse 2-fido disco carnosio basi circumdato.—*Hiern in Oliv. Fl. Trop. Afr.* iii. 71.

HAB. Fernando Po, *Mann* (No. 167).

Frutex 12-15-pedalis. *Folia* $1\frac{1}{2}$ -2-poll. longa; *petiolus* $\frac{1}{10}$ - $\frac{1}{8}$ -poll. longus; *stipulæ* $\frac{1}{8}$ -poll. longæ. *Flores* $\frac{1}{12}$ - $\frac{1}{10}$ -poll. longi.

From near Lagos Dr. Rowland sent to Kew in 1890 specimens in fruit of a very close ally of the above, though probably a distinct species. It differs in having from seven to nine primary lateral veins in the leaves, and the ultimate veinlets are less distinctly parallel. The costa above also is strigillose, while beneath it is glabrous, or nearly so. The fruit (figured from the Lagos plant) is globose, size of a small pea, with a smooth thinly fleshy pericarp; the seeds very numerous, ellipsoidal, with a scrobiculate crustaceous red-brown testa.—*D. OLIVER.*

Rhabdostigma Kirkii, Hk. f.

PLATE 2275.

RHABDOSTIGMA KIRKII, *Hook. f.*

RUBIACEÆ. Tribe ALBERTEÆ.

R. Kirkii, *Hook. f. in Gen. Plant.* ii. 109; arbuscula glaberrima ramis tetragonis, foliis ellipticis v. oblongo-ellipticis obtusis v. obtuse acutatis, basi in petiolum angustatis, tenuiter coriaceis nervis primariis lateralibus haud conspicuis utrinque 6-7, stipulis late deltoideis acutis coriaceis persistentibus, paniculis axillaribus folio 2-plo longioribus pedunculatis ramis laxè divergentibus, pedicellis gracilibus sæpe flore longioribus, bracteis parvis coriaceis lanceolatis acutis, calycis limbo 5-fido dentibus parvis ovato-deltoideis obtusiusculis, corollæ rotatæ tubo quam calycis limbo multo longiore, ore dense barbato, lobis tubo æquilongis v. longioribus oblongis v. lanceolato-oblongis obtusis æstivatione sinistrorsum tortis, staminibus exsertis paullo infra sinubus insertis, filamentis brevissimis, antheris anguste lineari-lanceolatis connectivo apice apiculato. Hiern in *Oliv. Fl. Trop. Afr.* iii. 131.

HAB. East Tropical Africa, Quiloa, *Kirk* (No. 105).

Folia 3-4 poll. longa, $1\frac{1}{4}$ - $1\frac{3}{4}$ poll. lata; *petiolus* $\frac{1}{8}$ - $\frac{1}{6}$ poll. longus. *Stipulæ* $\frac{1}{8}$ - $\frac{1}{4}$ poll. longæ atque latæ. *Flores* $\frac{1}{2}$ poll. diam.

The foliage and twigs dry a dark reddish- or purple-brown. No specimens of this plant have reached us since those originally received from Dr., now Sir John, Kirk, twenty-five years ago. The ripe fruit is not known. I observe that M. Baillon in his 'Histoire des Plantes,' vii. 431, reduces this genus to *Galiniera*. The ovules are solitary in our plant; the general *facies* is not that of *Galiniera*, and until the seeds are forthcoming, the albumen of which is ruminated in *Galiniera*, I think *Rhabdostigma* should be maintained.—D. OLIVER.

Breweria Heudelotii, Baker.

PLATE 2276.

BREWERIA HEUDELOTII, Baker.

CONVOLVULACEÆ. Tribe CONVULVULÆ.

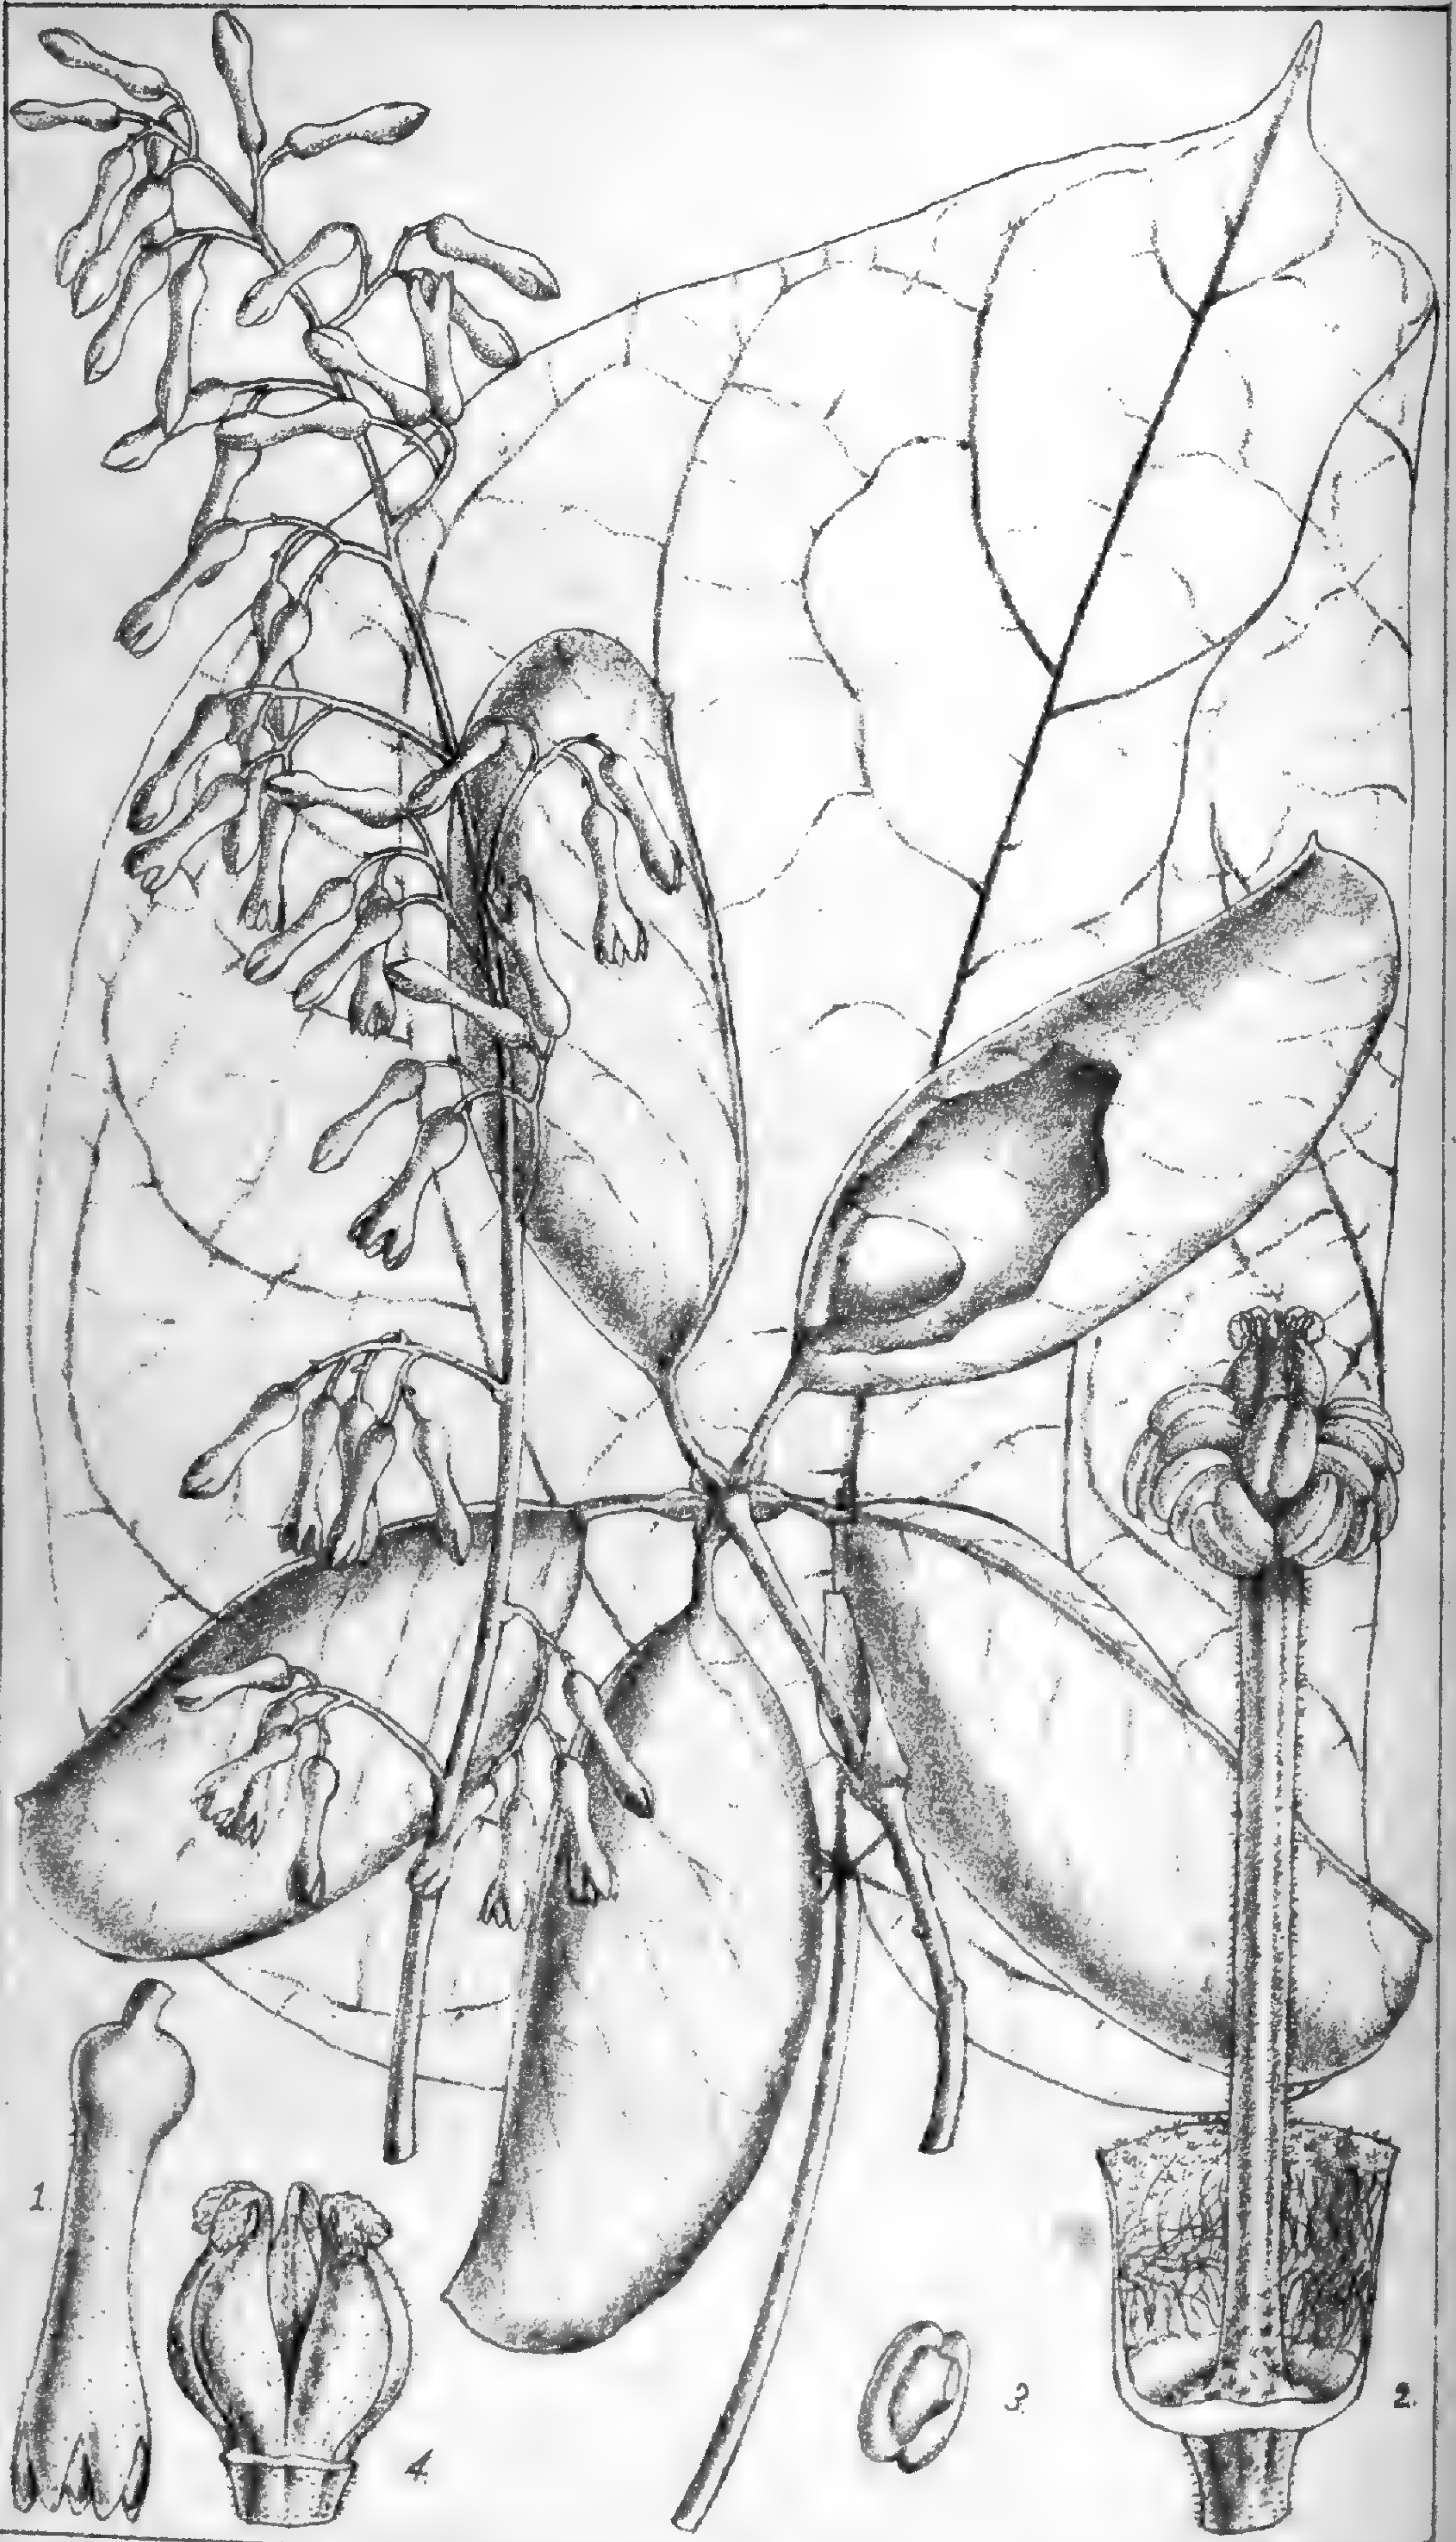

B. Heudelotii, Baker MSS. in Herb. Kew.; alte scandens, glabra, ramis foliiferis elongatis teretibus, foliis submembranaceis petiolatis ovato-ellipticis breviter obtuse cuspidatis nonnunquam emarginatis basi sæpius late rotundatis integris glabris, floribus pedicellatis in cymis axillaribus plurifloris cano-tomentellis interdum racemosim elongatis sed folio v. nonnunquam petiolo brevioribus dispositis, pedicellis bibracteatis bracteis ovato-ellipticis concavis, sepalis incanis, 3 interioribus tenuioribus ovato-ellipticis 2 exterioribus accrescentibus rotundato-cordatis exteriore cæteris majore, corollæ inflato-infundibuliformis calyce 6-8-plo longioris segmentis tubo 4-5-plo brevioribus late ovato-rotundatis, ovario ovoideo basi disco carnosulo adnato incrassato apice parce pilosulo, sepalo exteriore fructifero amplo rotundato membranaceo tenuiter venoso basi auriculato-cordato auriculis rotundatis imbricatis, sepalo proximo opposito minore ovato-cordato, interioribus tribus omnino occultis.

HAB. W. Trop. Africa; Senegambia, *Heudelot* (No. 864); Sierra Leone Boundary Commission, Berria, near Falaba (No. 5,230); and Duunia, Talla Hills (No. 5,018), *Scott-Elliot*.

Folia $3\frac{1}{2}$ -4 (- $5\frac{1}{2}$) poll. longa, 2- $2\frac{3}{4}$ poll. lata; petiolus $\frac{1}{2}$ -1 poll. longus. *Flores* 8-13 lin. longi, pedicelli $\frac{1}{4}$ - $\frac{1}{2}$ poll. longi; bracteolæ oppositæ $\frac{1}{10}$ - $\frac{1}{8}$ poll. longæ. *Stamina* inclusa prope basin tubi inserta, æstivatione antheris erectis. *Sepalum* exterius fructigerum 2 poll. longum atque latum.

Mr. Scott-Elliot's excellent specimens in flower and fruit enable us to furnish a satisfactory figure of a very interesting plant, of which the inadequate material of M. Heudelot has long been in this Herbarium. Its nearest ally is a plant collected by M. Soyaux on the Gabun (No. 80), which differs in its obovate, narrowly-cordate-based leaves, pubescent beneath (*B. mirabilis*, Baker MSS. in Herb. Kew.). *B. Codonanthus*, Baker (*Prevostea africana*, Benth., *Codonanthus*? *alternifolia*, Planch., in this work, t. 796), is also nearly related, but unknown to us in fruit. I leave this plant and its allies in *Breweria*, following the 'Genera Plantarum,' though one cannot but feel the generic bond strained almost to breaking when we compare it, for instance, with the Arabian species, formerly assigned to *Seddera*. It is curious to note how, in this case of a scandent species, the outer sepal simulates the accrescent bract in the similarly scandent and allied genus *Neuropeltis*.—D. OLIVER.

Sipolisia lanuginosa, Glazou

PLATE 2281.

SIPOLISIA LANUGINOSA, *Glaziov.*

COMPOSITÆ. Subtribe EUVERNONIÆ.

Sipolisia, *Glaziov MSS. in Hb. Kew. (gen. nov.)*. Capitula multiflora homogama tubuliflora in glomerulum terminalem aggregata. Involucrum bracteis exterioribus foliaceis ovatis v. intermediis ovato-lanceolatis dense argenteo-lanatis, interioribus anguste linearibus acuminatis recurvis apice purpureo-coloratis dorso superne lanatis. Receptaculum foveolatum, foveolæ marginibus irregulariter dentatis et in squamis ovario 2-3-plo longioribus planis rigidis lineari-subulatis productis. Corolla tubo graciliter cylindrico, limbi segmentis anguste linearibus gradatim acuminatis apice dorsaliter albido-pilosis. Stamina filamentis glabris; antheris exsertis linearibus, apice connectivo lanceolato acutiusculo membranaceo producto coronatis, basi auriculis breviter productis obtusis per paria connatis. Styli rami angustissimi setulosi. Achænia subcylindrica v. obscure angulata 10-costata, valleculis intermediis subplanis v. parum elevatis. Pappus caducissimus, setosus, setis 30-60 biseriatis inæquilongis leviter complanatis barbellatis basi angustatis (quasi stipitatis) in tubum corollæ basin vaginantem coalitis.—Frutex ut videtur, ramis cum lana argentea densa indutis. Folia alterna sessilia ovata v. ovato-lanceolata acutata subintegra v. obscure crenata utrinque dense stellato-tomentosa v. subtus lanata. Rami capituligeri axillares ut videtur, aphylli densissime lanati apice sub capitulis exterioribus glomeruli cum bracteis amplis foliaceis ovato-lanceolatis instructi.

S. lanuginosa, *Glaziov (sp. unica)*.

HAB. Brazil, near Diamantina, Minas Geraes, *Glaziov* (No. 19,470).

Folia 8-12 poll. longa, 3-5 poll. lata. Rami axillares floriferi 1-2 ped. longi. Bracteæ exteriores 4-6-10 poll. longæ. Glomeruli $2\frac{1}{2}$ -4 poll. diam. Involucri 1-1 $\frac{1}{2}$ poll. diam.

In the generic name of this noble Composite M. Glaziov commemorates the services to science of the Abbé M. M. Sipolis, Director of the Seminary of Diamantina, 'qui m'a toujours guidé avec une extrême bonté dans la plupart de mes excursions à l'intérieur de la province de Minas; l'entomologie lui doit une foule de découvertes précieuses, et la science en général beaucoup de services.' On the whole, perhaps, it is as nearly allied to *Proteopsis* as to any described genus of Vernoniaceæ, unless it be to some of the *Lychnophoreæ*, the genera of which are, I fear, too artificially distinguished. In the same collection with our present plant, M. Glaziov sends another lanate plant with the aspect entirely of a *Lychnophora* (*L. villosissima*, Mart.), but the capitula are in terminal ovoid spiciform heads, and the individual capitula may contain from twelve to twenty florets. The corollas and anthers are, unfortunately, too much injured for description, with a figure, in this work.—D. OLIVER.

Fig. 1. Involucral scale. 2. Portion of receptacle with squamæ. 3. Bud. pappus partially removed. 4. Expanded floret, pappus removed. 5. Seta of pappus. 6. Anthers. 7. Style-branches. 8. Achene. *Enlarged*.

M.S. del, et lith.

Eremanthus purpurascens, Oliv.

PLATE 2282.

EREMANTHUS PURPURASCENS, Oliv.

COMPOSITÆ. Tribe VERNONIACEÆ.

E. purpurascens, Oliv. (sp. nov.); acaulis, caudice lignoso abbreviato basibus foliorum delapsorum dense sericeo-tomentosis arcte induto, foliis lineari- v. oblongo-spathulatis obtusis basi angustatis coriaceis marginibus plus minus revolutis supra (in sicco) corrugatim-rugosis primum sericeo-lanatis denique glabratis subtus albido-lanatis, scapis lanatis folio brevioribus, glomerulo hemisphærico, bracteis paucis foliaceis oblongis albido-tomentosis involucre, capitulis 4-6 congestis 8-10-floris, involucre proprio pappo æquilongo, bracteolis lineari-oblongis lanceolatisve dorso sericeo-villosis, ovario 10-costato, pappo purpurascente ovario 4-5 longiore.

HAB. Brazil, Minas Geraes, *Glaziou* (No. 19,464).

Folia 1-1 $\frac{3}{4}$ poll. longa, $\frac{1}{4}$ - $\frac{1}{3}$ poll. lata. *Glomerulus* 1 poll. diam., *scapus* $\frac{2}{3}$ - $\frac{3}{4}$ poll. longus. *Bracteæ* exteriores $\frac{3}{4}$ poll. longi, *involucri bracteolæ* 5-6 lin. longæ.

The nearest ally of this species would appear to be *E. eriopus*, Baker, a species known to me only from description.—D. OLIVER.

Fig. 1. Involucral scale. 2. Floret. 3. Seta of pappus. 4. Anthers. 5. Style. *Enlarged.*

M.S. del., et lith.

Vangueria nigrescens, Scott-Elliot.

PLATE 2283.

VANGUERIA NIGRESCENS, *Scott-Elliot*.

RUBIACEÆ. Tribe VANGUERIEÆ.

V. nigrescens, *Scott-Elliot, MSS. in Herb. Kew.*; inermis, glaberrima, ramis gracilibus teretibus, foliis petiolatis oblongo-ellipticis obtuse acuminatis venis primariis utrinque 5-7, cymis axillaribus plurifloris breviter pedunculatis bracteatis folio multo brevioribus, bracteis ovatis v. ovato-lanceolatis sæpe obtusis membranaceis internodiis inflorescentiæ longioribus, calycis limbo 5-partito, segmentis ovato-lanceolatis tubo campanulato v. hemisphærico 4-5-plo longioribus, corollæ segmentis lineari-oblongis apice abrupte caudatis tubo subæquilongis parce setoso-ciliatis, staminibus sinus corollæ insertis segmentis multo brevioribus, ovario 5-loculare, stigmate calyptriforme ellipsoideo.

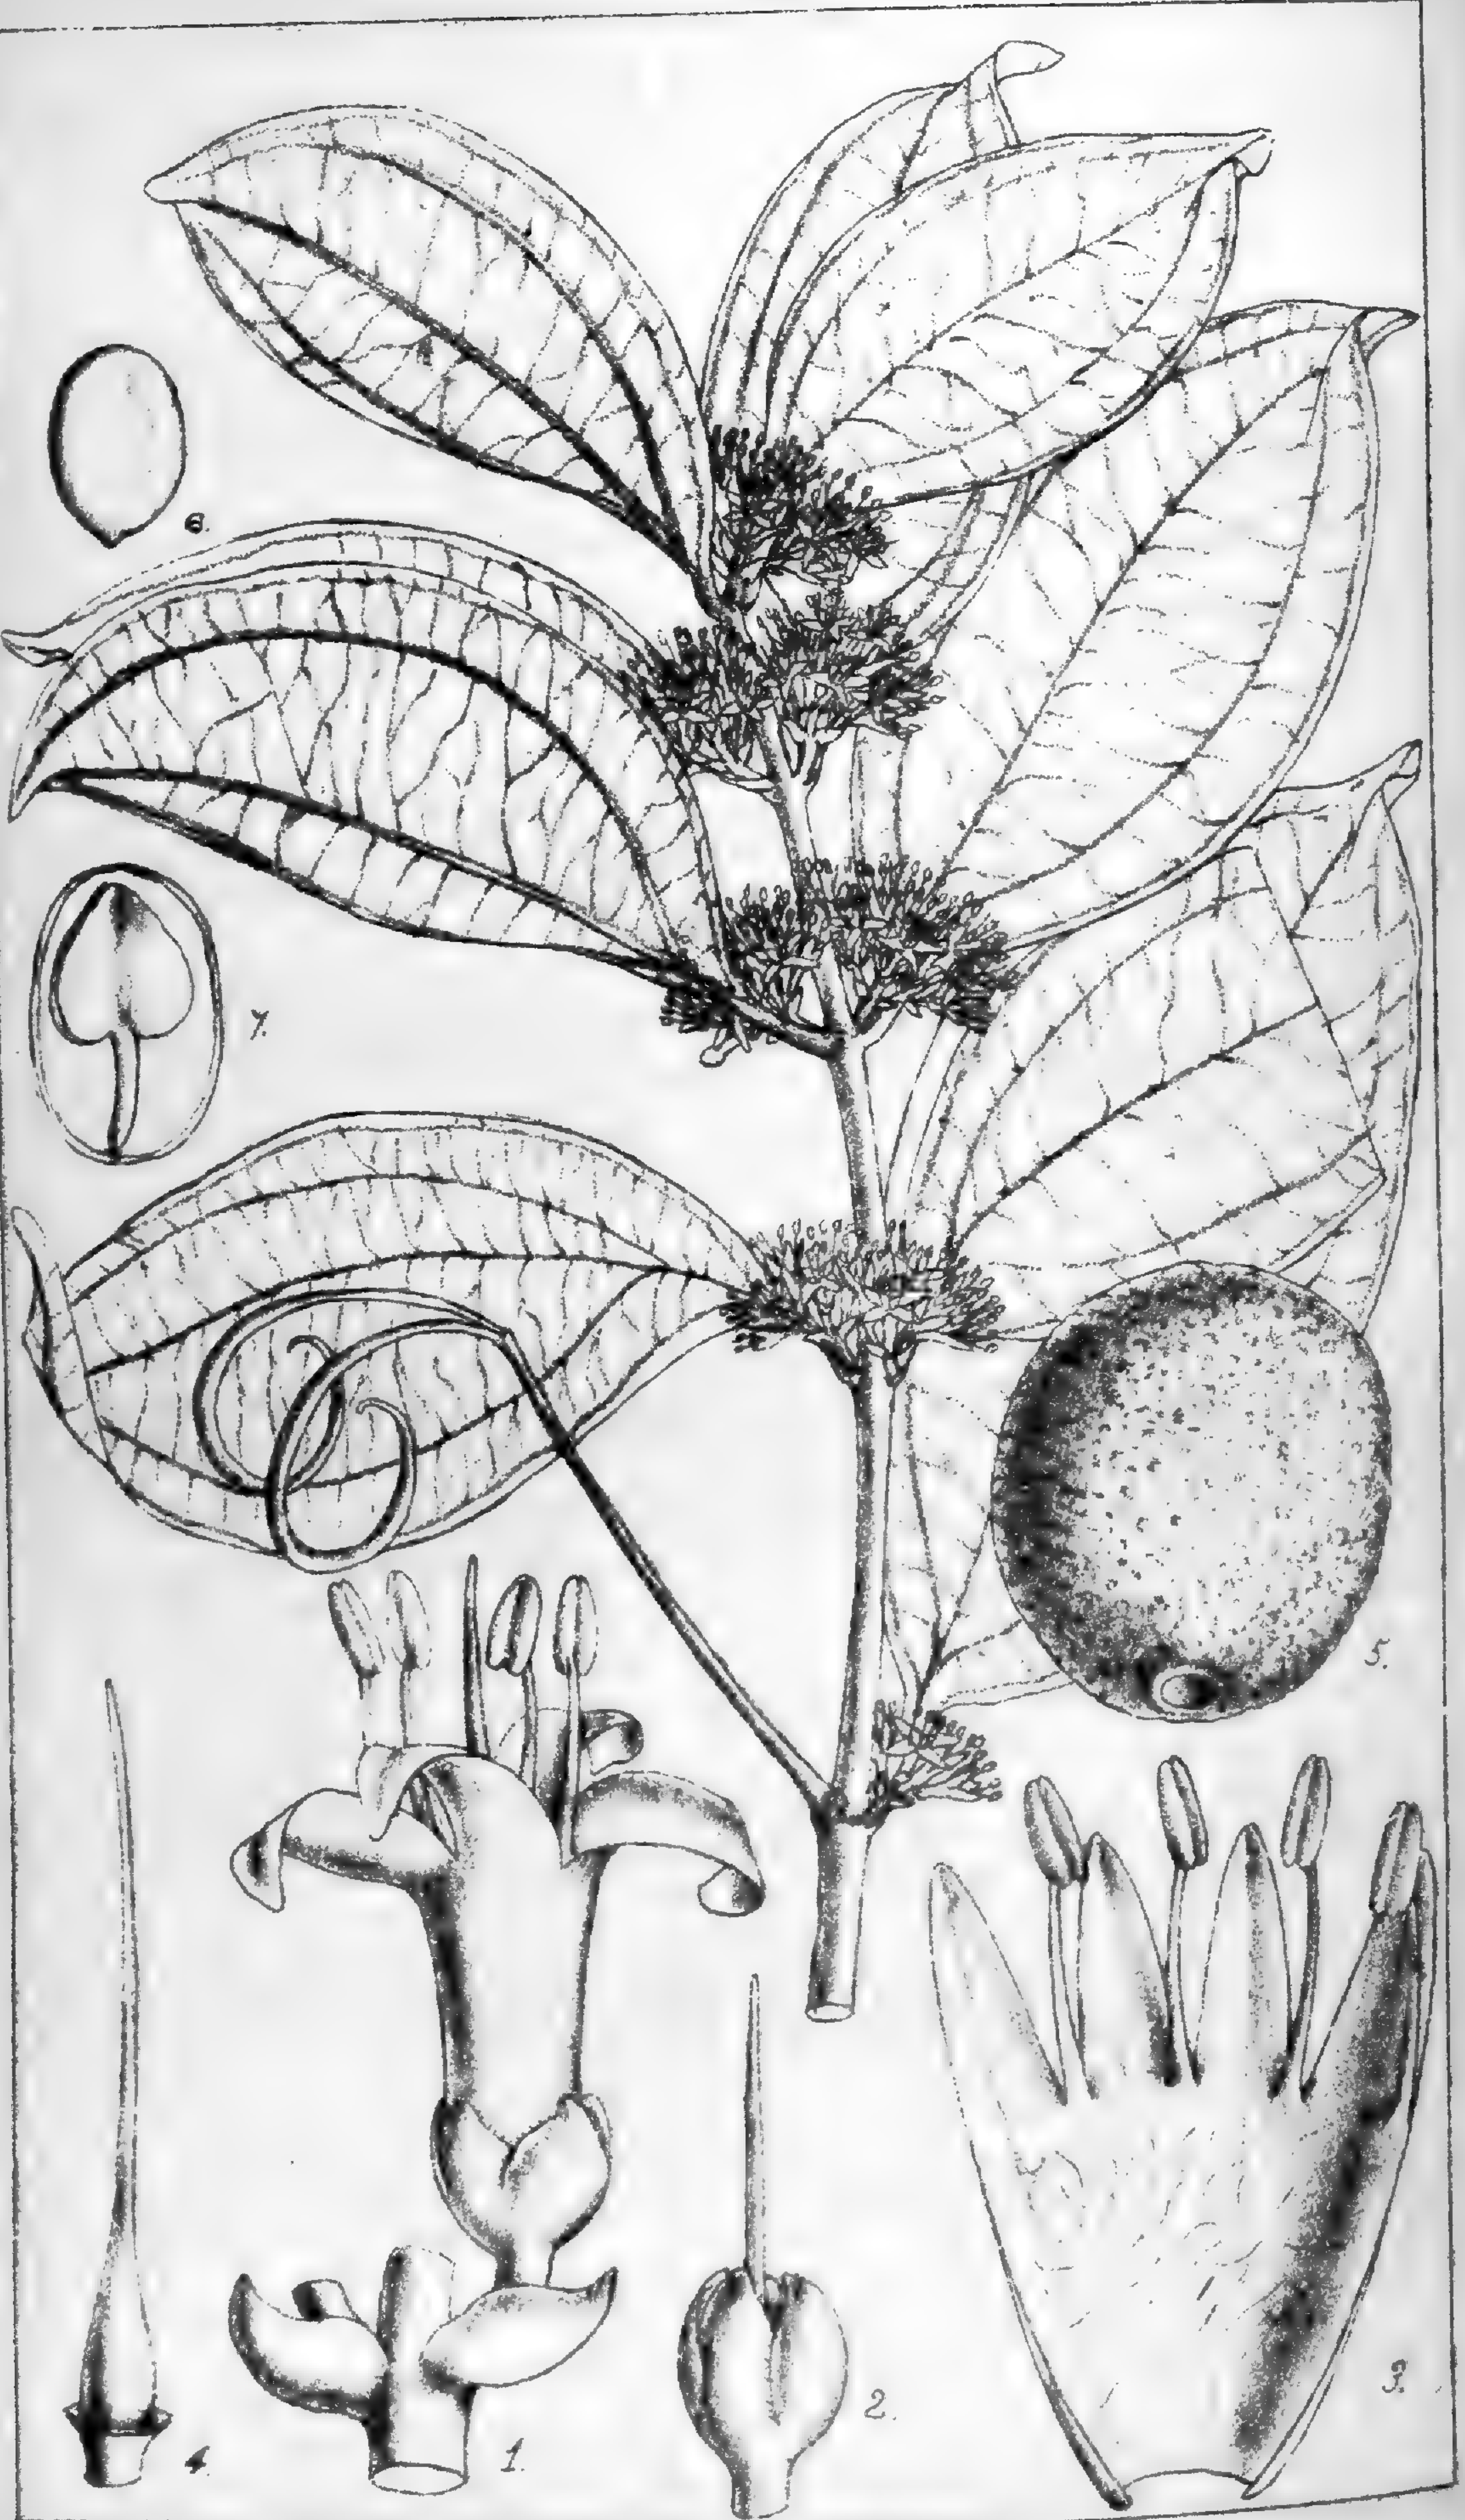

HAB. W. Trop. Africa. Sierra Leone Boundary Commission, near Falaba (No. 5,736) and Kafogo (No. 5,610), *Scott-Elliot*.

Folia (in spp. exsicc.) nigrescentia, membranacea, $2\frac{1}{2}$ - $3\frac{1}{2}$ poll. longa, $1-1\frac{1}{2}$ poll. lata; petiolus $\frac{1}{4}$ - $\frac{1}{3}$ poll. longus; stipulæ deltoideæ, apiculatæ v. acuminatæ, basi connatæ. *Pedunculi* $\frac{1}{2}$ poll. longi; bracteæ 4-6 lin. longæ. *Calyx* segmentis $\frac{1}{3}$ poll. longis. *Corolla* segmentis cum caudis 6-7 lin. longis.

Very different from the only species with caudate corolla-lobes described in the 'Flora of Tropical Africa,' *V. velutina*, Hiern, with densely tomentose leaves and inflorescence, and *V. pauciflora*, Schweinf., with solitary or geminate flowers and truncate calyx.

So far as I can judge from the specimens, the copious inflorescence and conspicuous flowers of this species make it a desirable plant for stove cultivation.—D. OLIVER.

Fig. 1. Segment of calyx. 2. Corolla laid open. 3. Pistil, ovary in vertical section. 4. Transverse section of ovary. *All*

M S del, et lit.

Strychnos Barteri, Solered.

PLATE 2284.

STRYCHNOS BARTERI, *Soler.*

—
LOGANIACEÆ. Tribe EULOGANIEÆ.

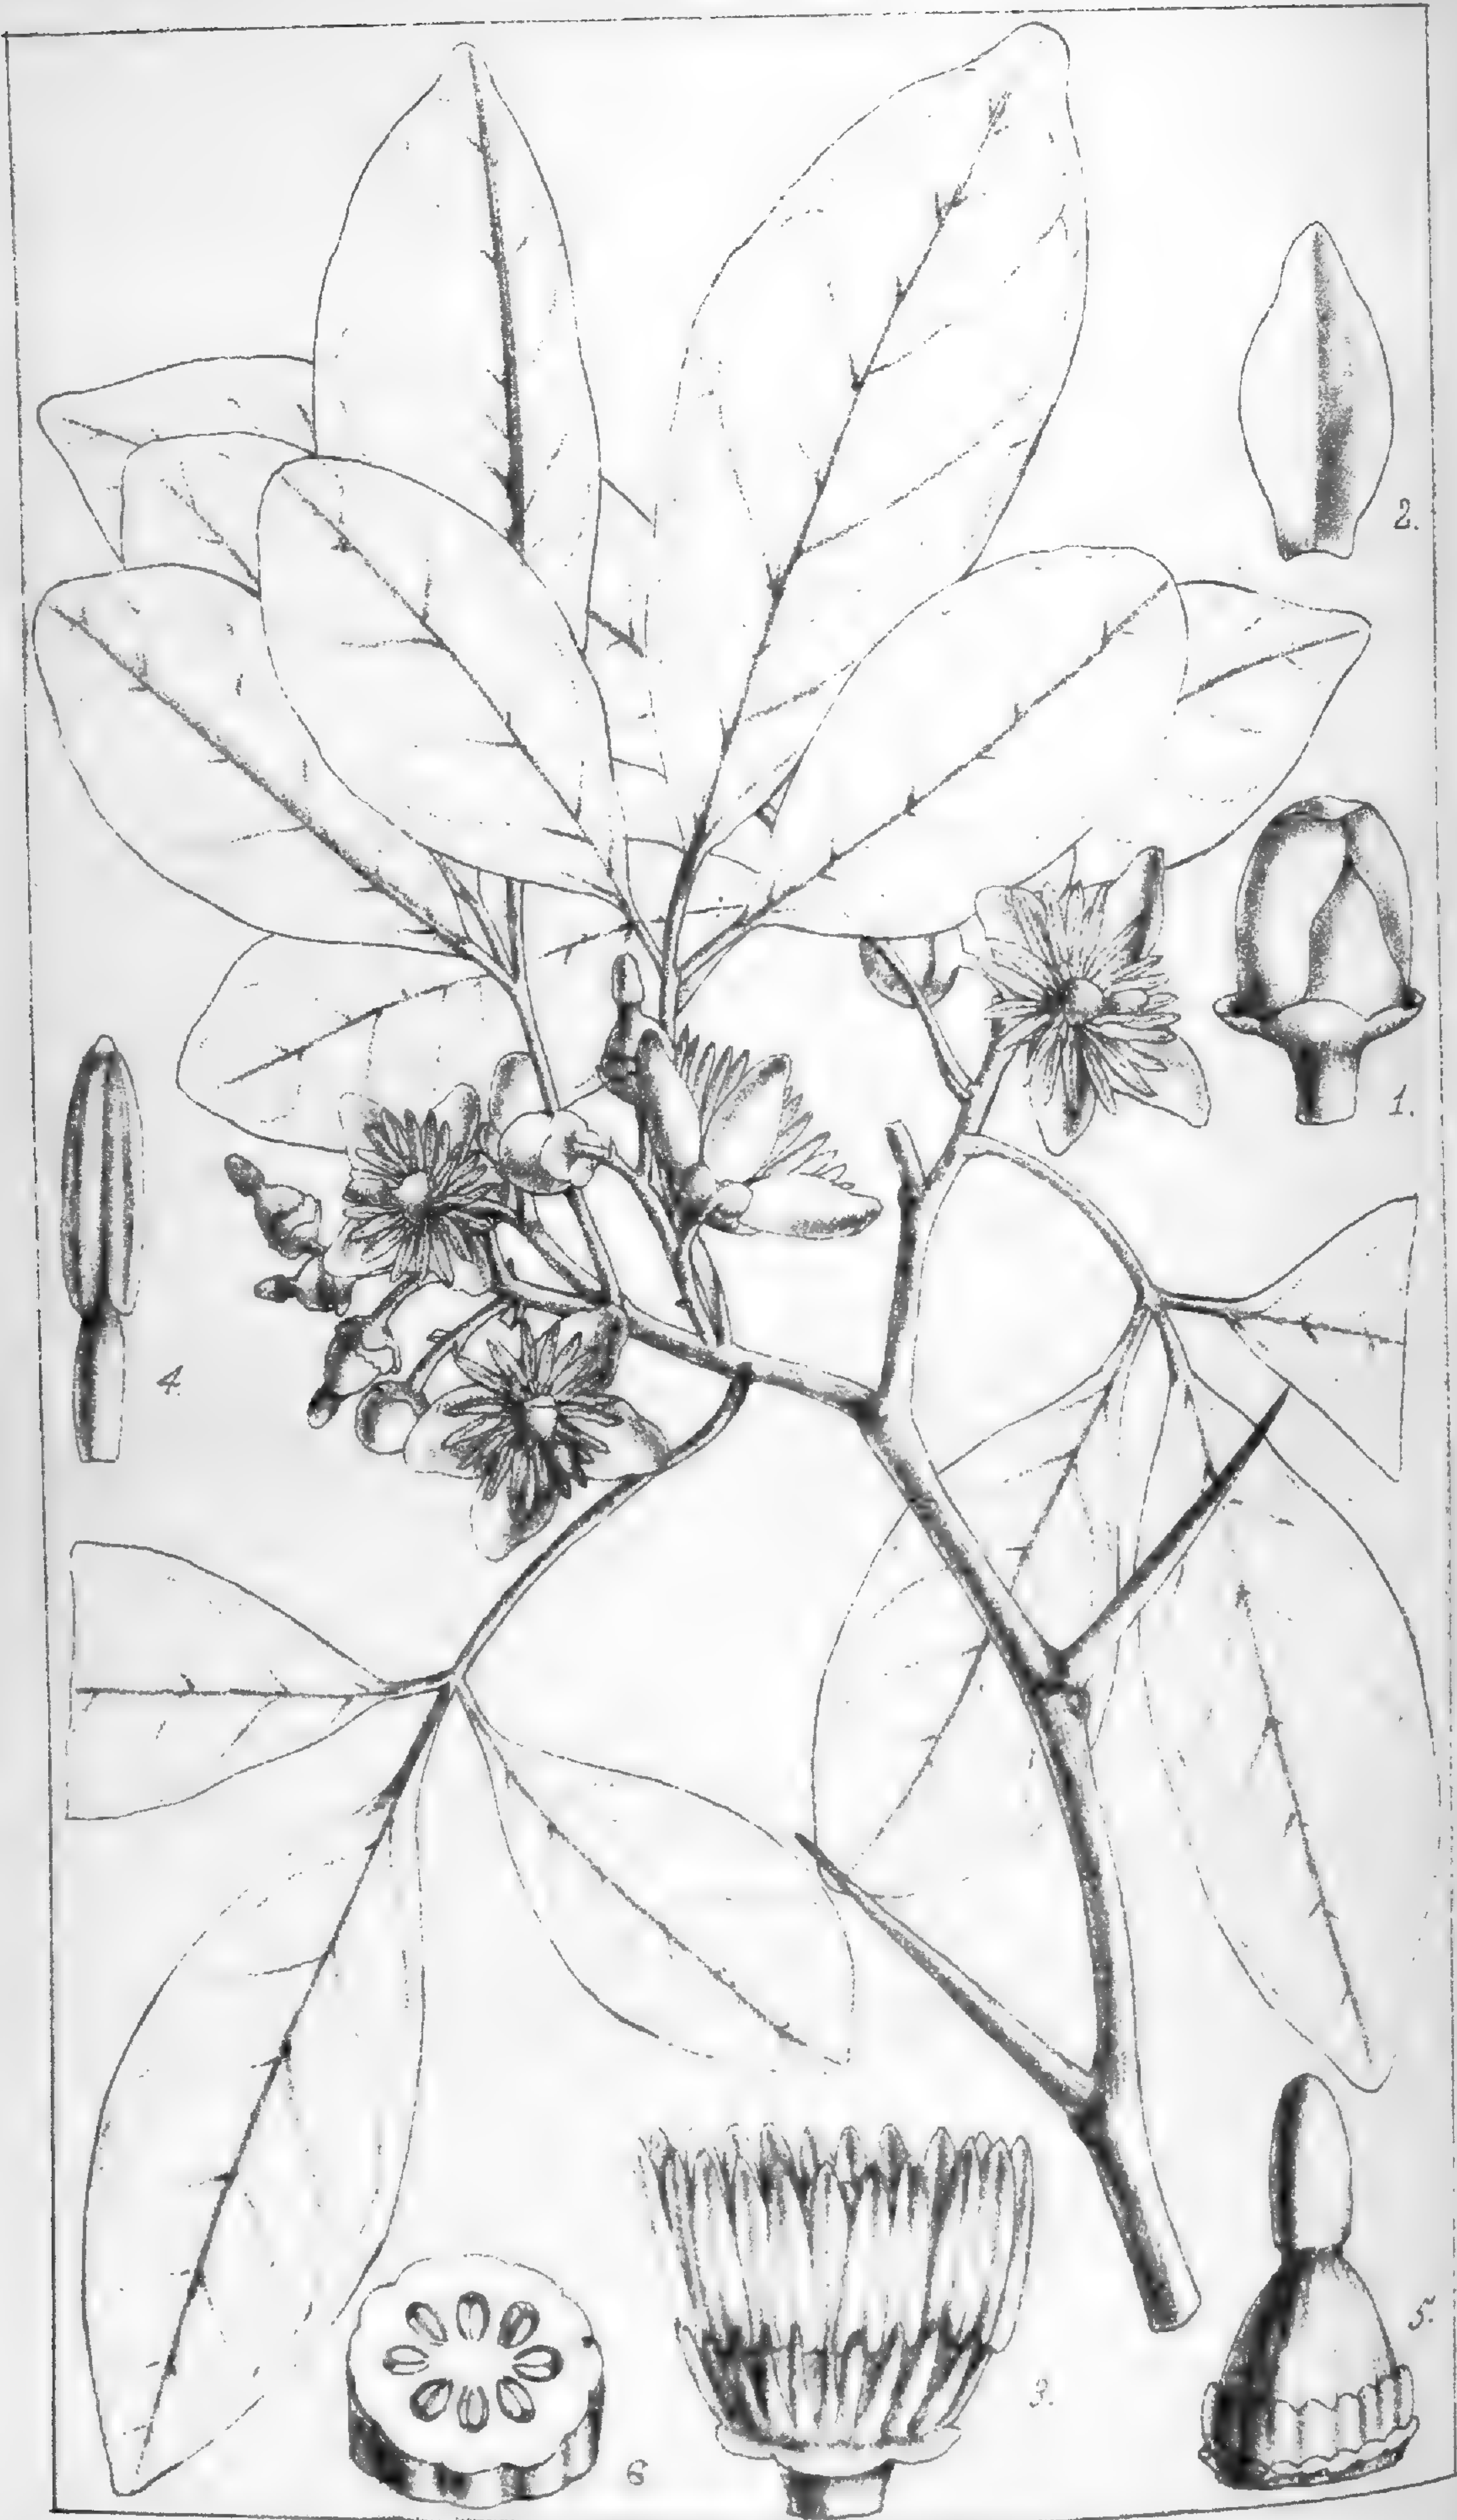

S. Barteri, *Solereder* in Engler, *Bot. Jahrb.* xvii. (1893), 556; frutex cirrhiferus glaberrimus, cirrhis bifurcatis curvaturis incrassatis, ramulis obscure tetragonis, foliis coriaceis læte viridibus ellipticis breviter et late apiculatis triplinerviis, cymis axillaribus sessilibus v. brevissime pedunculatis multifloris, bracteis late ovatis concavis pedicellis æquilongis v. eisdem brevioribus sæpissime ebracteolatis, sepalis 4 ovato-rotundatis breviter late apiculatis v. obtusis, corollæ 4-fidæ segmentis lineari-oblongis tubo æquilongis tubo intus sæpius plus minus piloso extus glabro, staminibus exsertis, bacca globosa oligosperma, seminibus compressis ellipticis, embryone albumine fere æquilongo cotyledonibus planis subcordiformibus radiculae rectæ æquilongis.

HAB. W. Trop. Africa, Onitscha, Nigritania, *Barter* (Nos. 1,247, 1,759); Sierra Leone Boundary Commission, Madina, Limba Country, *Scott-Elliott* (Nos. 5,569; 5,659).

Folia 2–3 poll. longa, 1–1 $\frac{3}{4}$ (–2) poll. lata; *petiolus* $\frac{3}{4}$ – $\frac{1}{4}$ poll. longus. *Cirrho* geminati, pedunculati, pedunculus 1 $\frac{1}{2}$ poll. longus. *Cymæ* congestæ $\frac{1}{2}$ –1 poll. diam. *Flores* 2 $\frac{1}{2}$ –3 lin. longi, albi. *Bacca* crustacea, 1–1 $\frac{1}{4}$ poll. diam.

There are some slight differences between the Niger and Sierra Leone specimens. The inflorescence of the latter is not quite so compact, and the sepals are connivent over the ovary; but this is after the fall of the corolla, and is probably the case in the Niger plant, the specimens of which are not so far advanced. The throat of the corolla is more densely pilose in the specimens from Sierra Leone. This plant is clearly a very near ally of *Strychnos densiflora*, Baillon in *Adansonia*, xii. 369, which in its turn is nearly related (by “les plus étroites affinités”) to *S. Icaja* of the same author, of which, indeed, he says it may be only a simple form or variety. The leaves of these plants described by Professor Baillon are considerably larger than in our plant (in *S. Icaja* 4–6 ins. in length), and in *S. densiflora* a pair of bracteoles occurs at the extremity of the pedicel closely appressed to the calyx. Bracteoles in this position I fail to find in *S. Barteri*, in which, moreover, the flowers are considerably smaller. I do not find any note of the size of the fruit in *S. densiflora*.—D. OLIVER.

Fig. 1. Flower and bracteoles. 2. Calyx. 3. Corolla laid open. 4. Pistil. 5. Fruit. 6. Seed. 7. Longitudinal section of same. *Analyses all enlarged.*

Aegle Barteri, Hk. fil.

PLATE 2285.

ÆGLE BARTERI, *Hook. f.*

RUTACEÆ. Tribe AURANTIEÆ.

Æ. Barteri, *Hook. fil. MSS. in Herb. Kew.*; arbuscula spinosa glabra, spinis rectis gracilibus axillaribus petiolo sæpius brevioribus, foliis petiolatis trifoliolatis, foliolis membranaceis obovato- v. oblongo-ellipticis obtusis sæpe emarginatis basi in petiolulum angustatis obscure undulato-crenatis pellucide glanduloso-punctatis, racemis pauci- v. pluri-floris axillaribus v. quasi terminalibus, staminibus c. 15-20, disco crasso ovarii basin cingente sulcato ovario subgloboso v. ovoideo-globoso latiore, loculis ovarii 8, ovula in loculis 12-18.

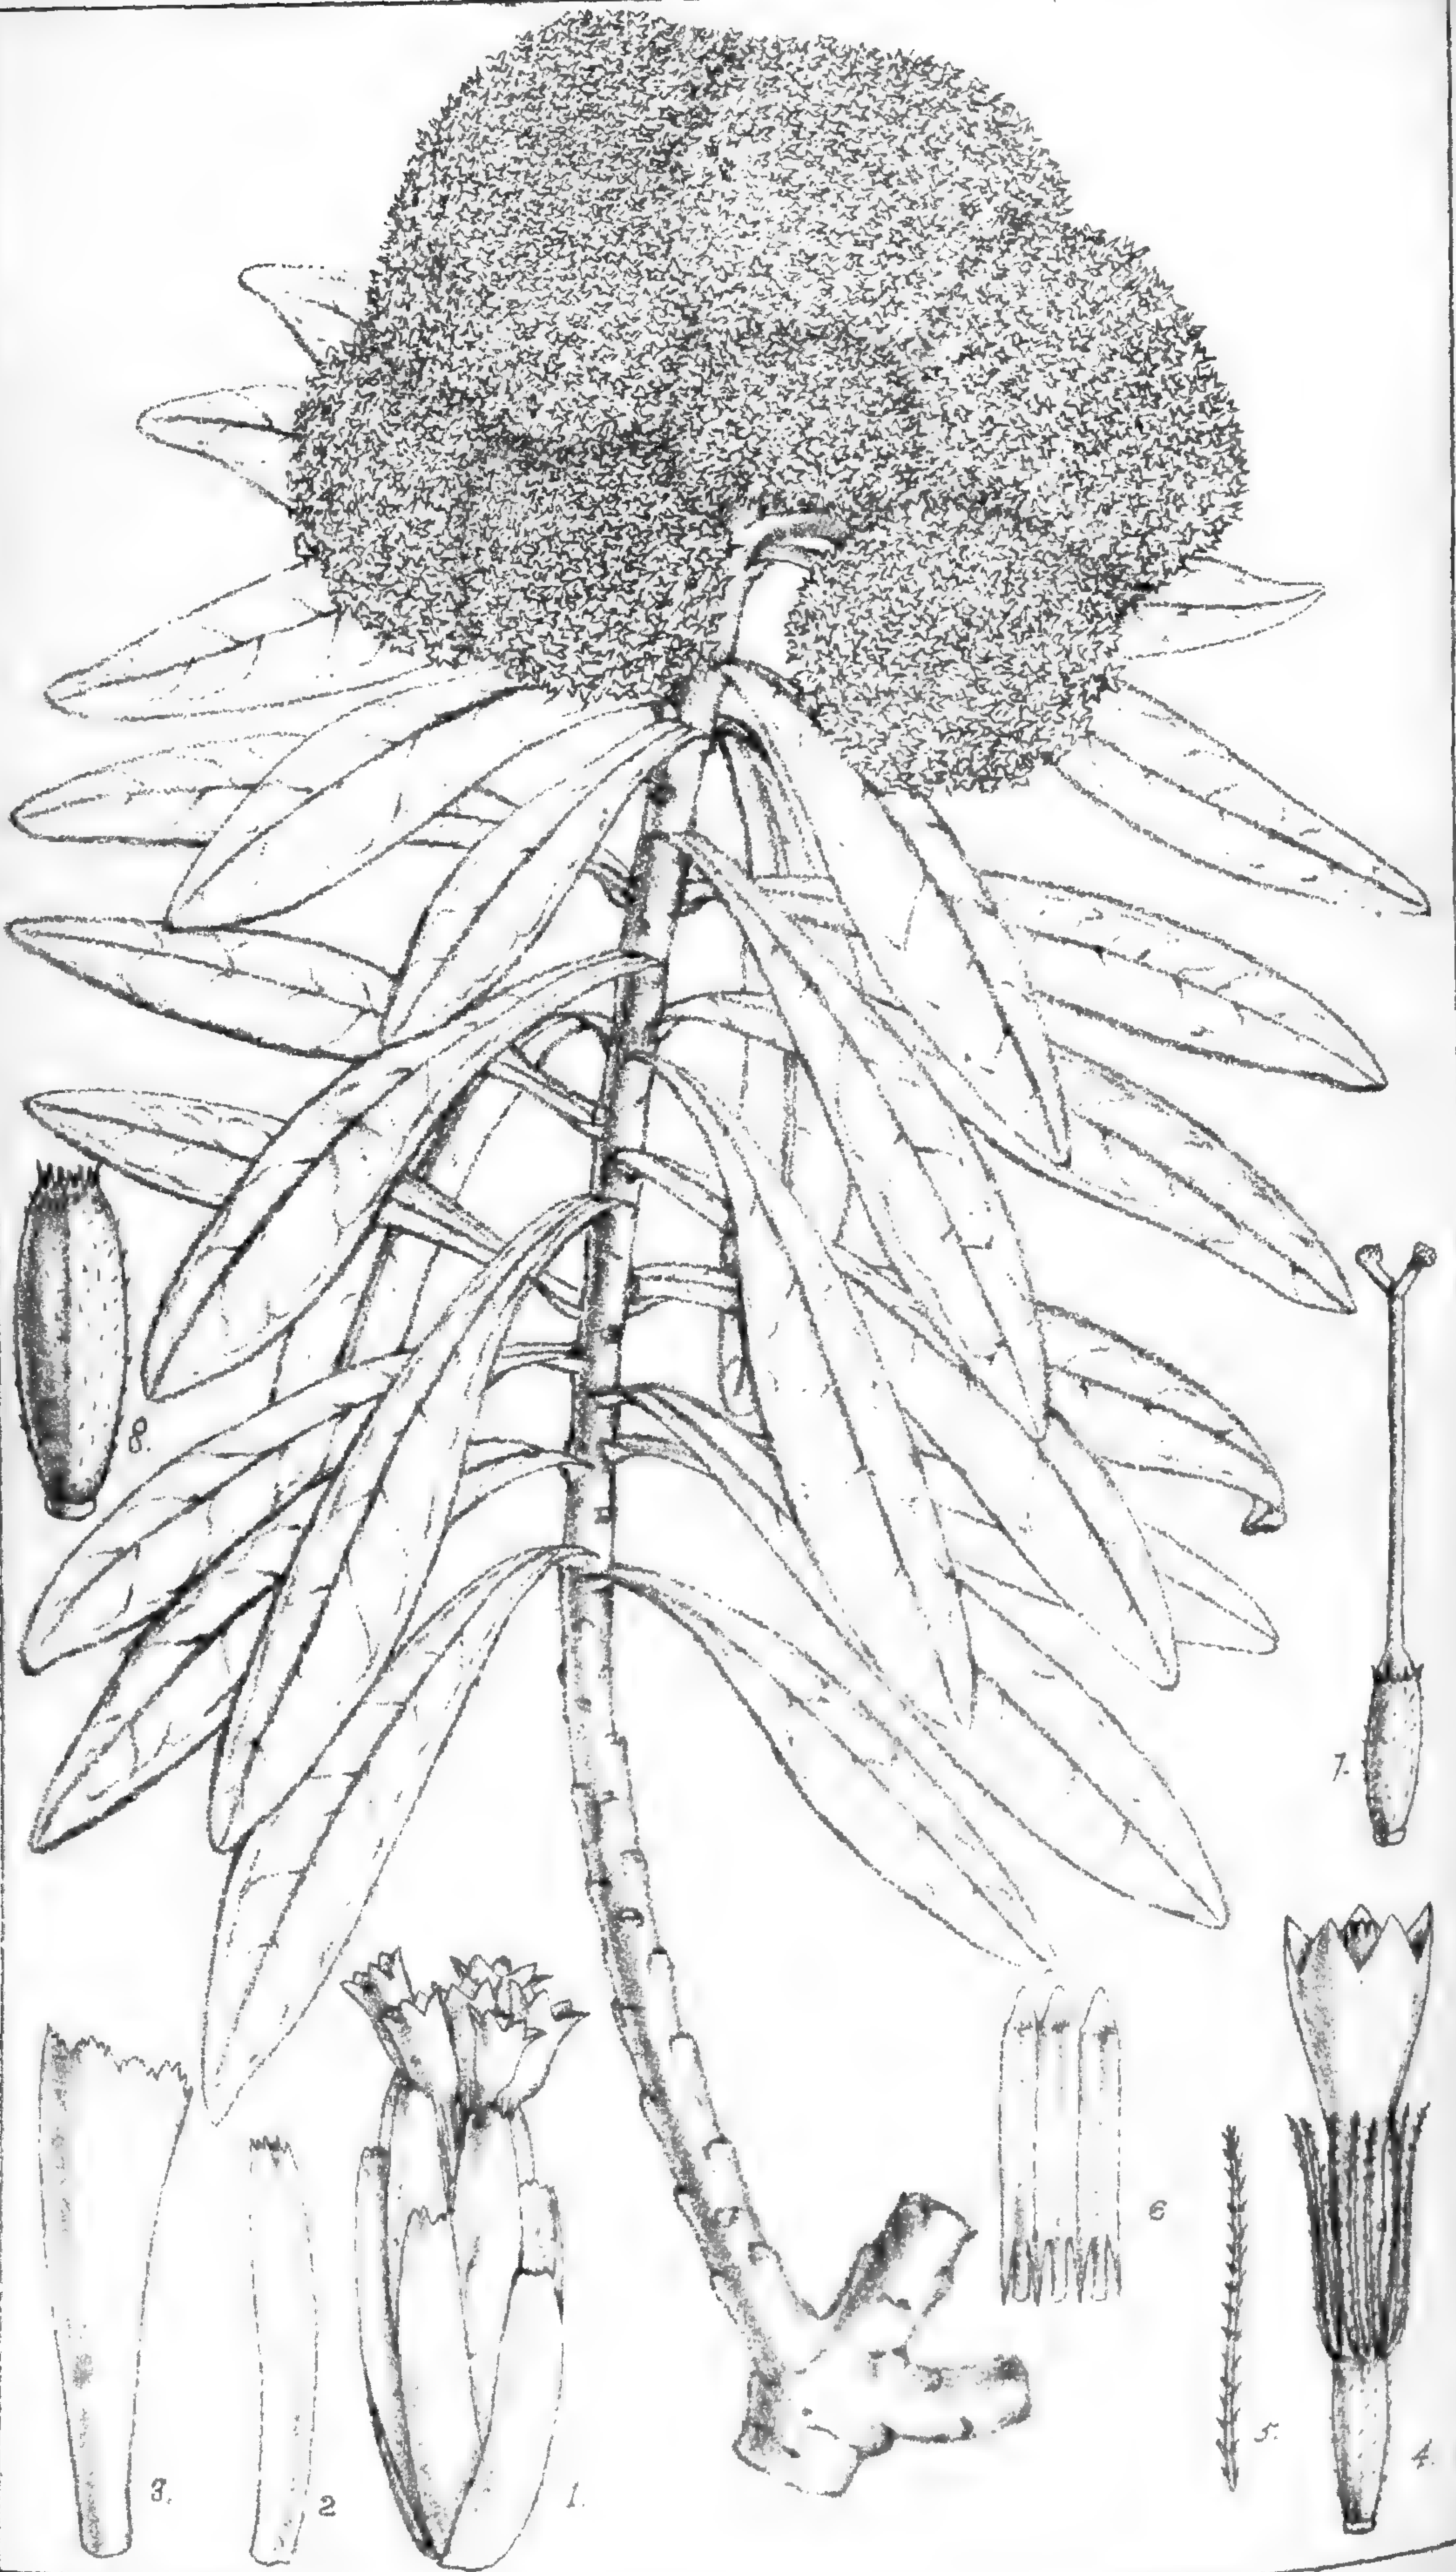

HAB. Trop. West Africa, Nigritania, 'Ogbomorham,' *Barter* (No. 3,404). Abeokuta, *Rowland*.

Foliola $1\frac{1}{2}$ - $2\frac{3}{4}$ poll. longa, 10-14 lin. lata; petiolus $1-1\frac{1}{2}$ poll. longus; petioluli (foliol. centr.) $\frac{1}{3}$ - $\frac{1}{2}$ poll. longi. *Racemi* 1-2 poll. longi; pedicelli breves. *Calyx* obscure et late rotundato-lobulatus. *Petala* elliptico-oblonga, imbricata. *Stamina* 13-20, libera. *Bacca* globosa cortice ligneo.

Mr. Barter describes the fruit 'as large as a shaddock, hard-shelled and uneatable. Calabashes are made of it.' This is a very near ally of the well-known 'Bael Tree' of India (*Æ. Marmelos*, Corr.), differing, as pointed out by Sir J. Hooker in the Kew Herbarium, in its more globose ovary, larger lobed disks, and fewer cells of the ovary, to which differences may be added the fewer stamens and more obtuse leaflets, usually not, as in *Æ. Marmelos*, more or less narrowed to an obtuse apex.

Whether rightly distinguished specifically or not, the occurrence of an *Ægle* in Nigritania, differing from the Bael chiefly in the floral characters mentioned, is of much interest.—D. OLIVER.

Fig. 1. Bud. 2. Petal. 3. Andrœcium. 4. Detached stamen. 5. Pistil and disk. 6. Transverse section of ovary. *All enlarged.*

Helichrysum densiflorum, Oliv.

PLATE 2286.

HELICHRYSUM DENSIFLORUM, Oliv.

COMPOSITÆ. Subtribe GNAPHALIÆ.

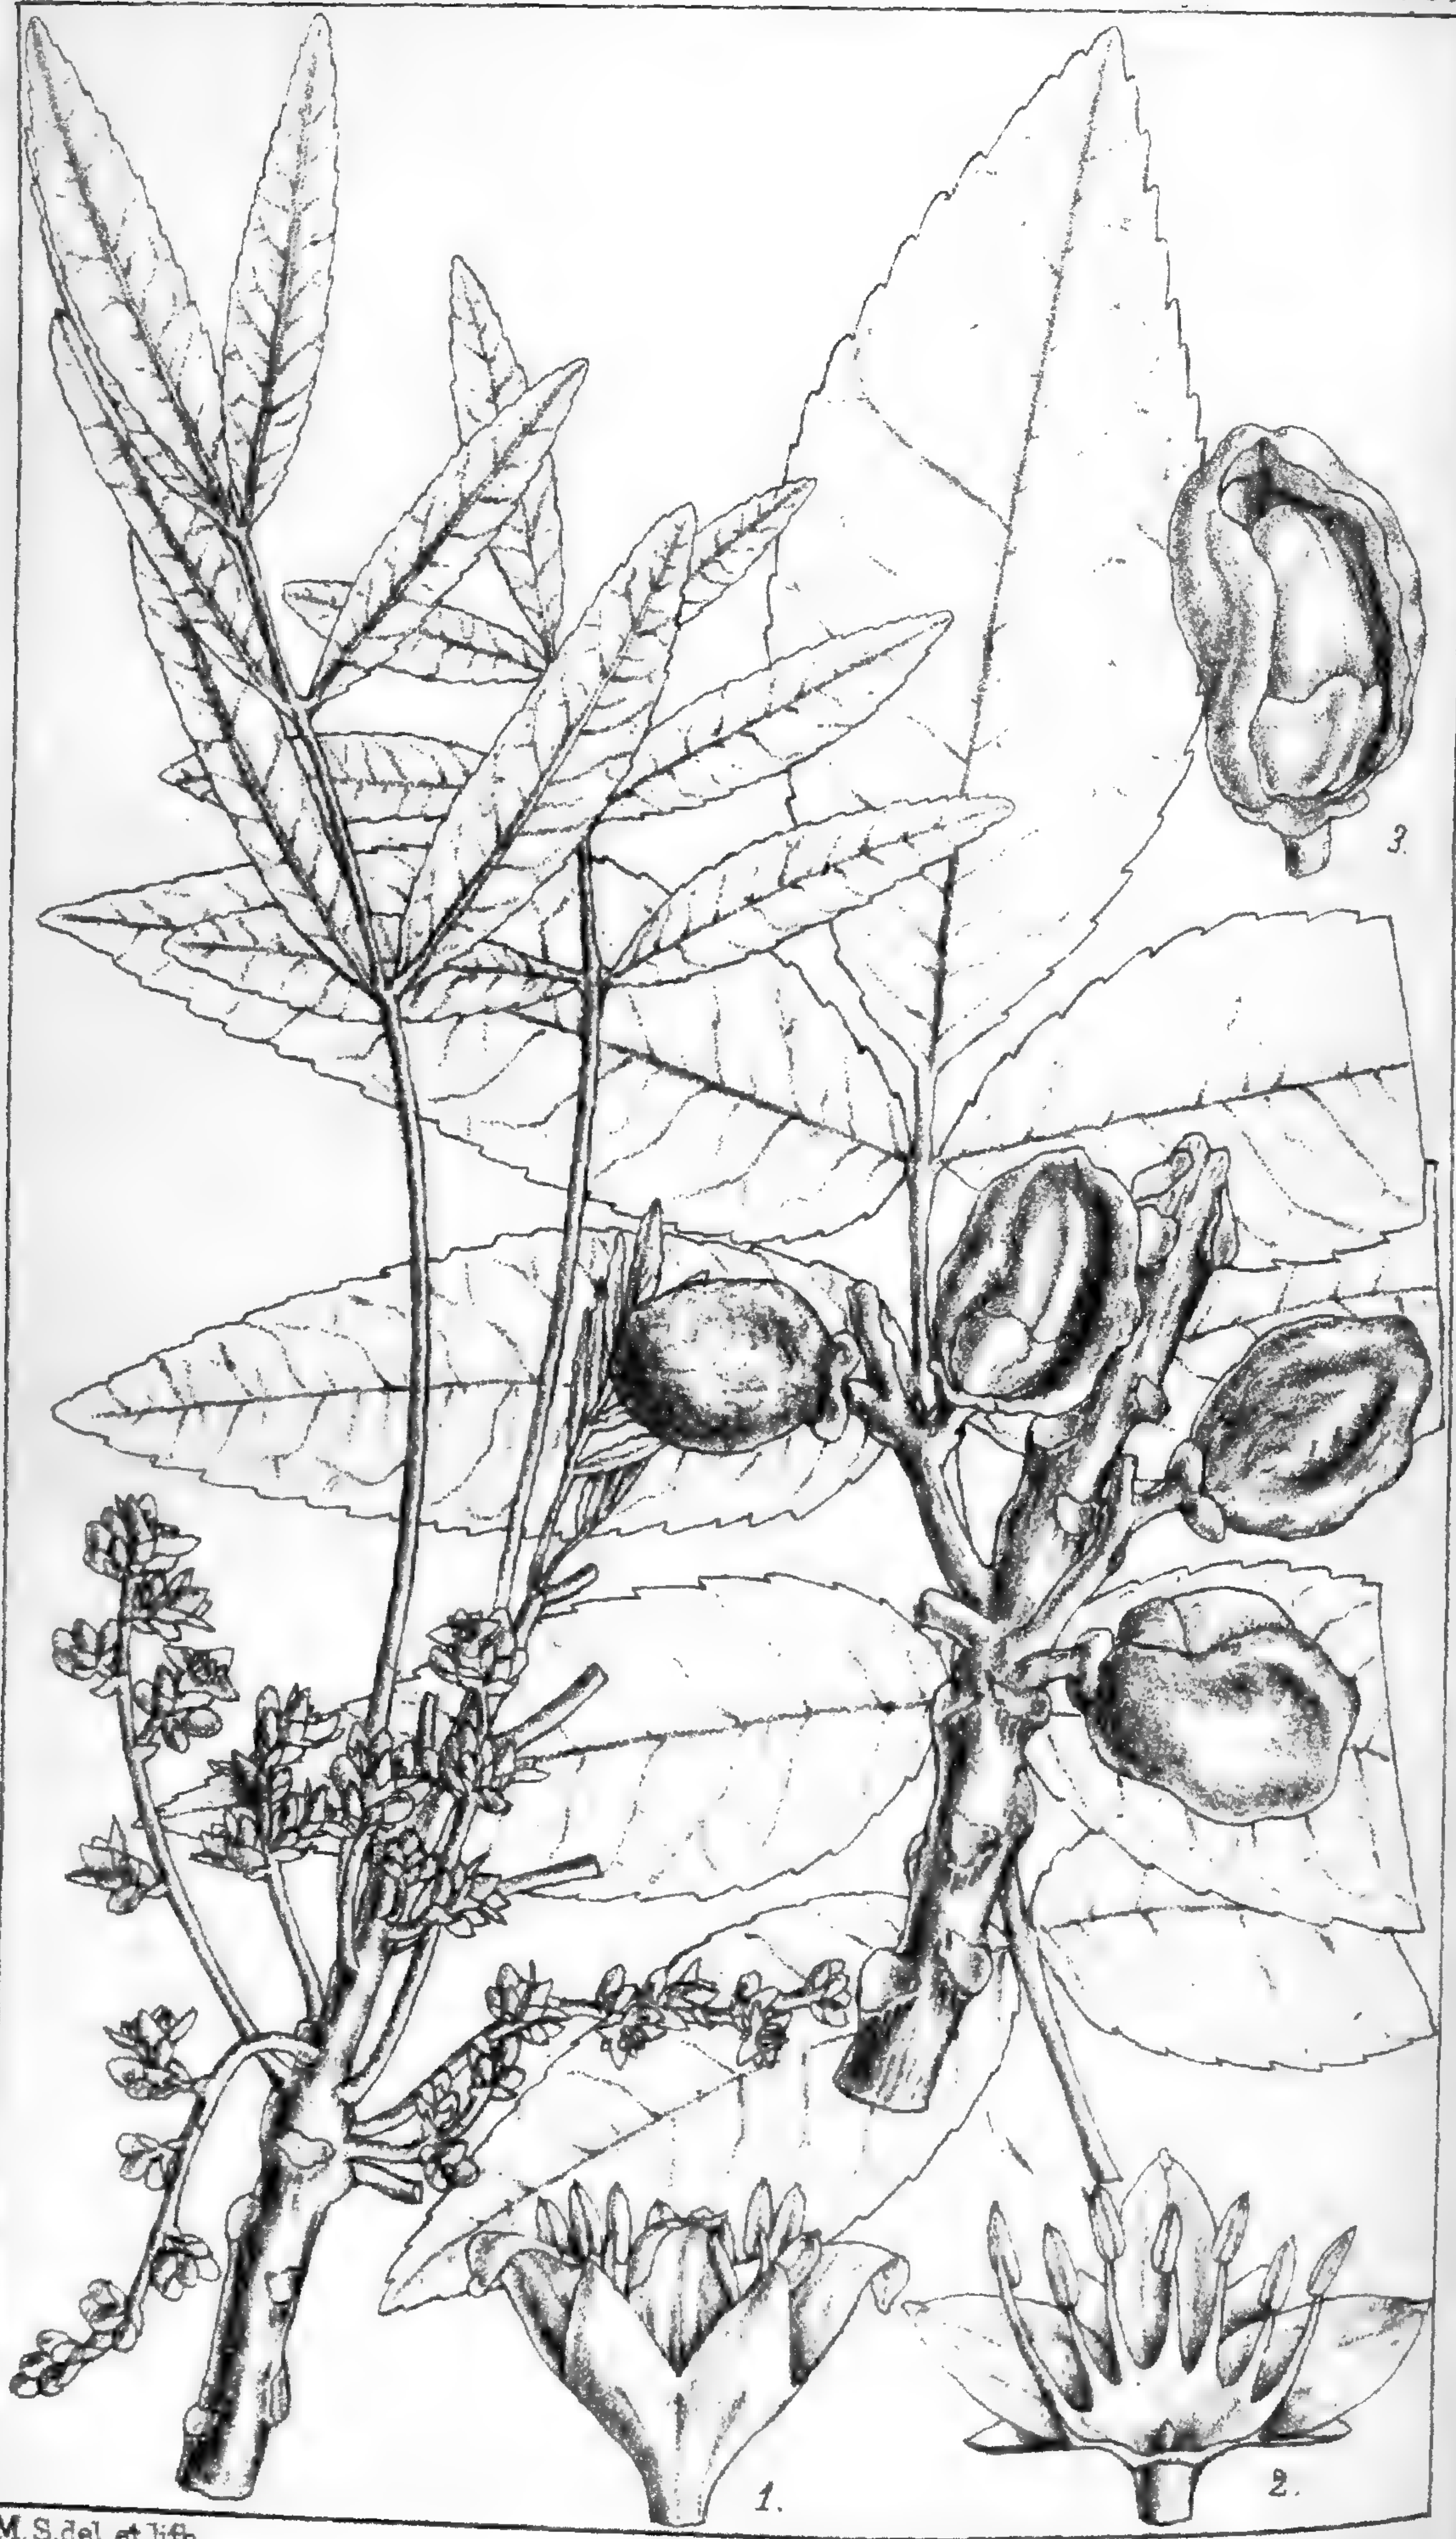

H. densiflorum, Oliv. (*sp. nov.*); frutex ramis teretibus crassitie pennæ olorinæ cicatricibus foliorum delapsorum notatis, primum cano-tomentosis, foliis apices versus ramorum congestis anguste ovali-oblongis obtusiusculis mucronatis basi in petiolum sensim angustatis supra parce appresse tomentosus glabrescentibusve subtus dense cano-tomentosis obscure trinerviis, capitulis 4–6-floris homogamis in cymas densas breviter pedunculatas umbellatim subglobosas confertis, squamis involucri floribus brevioribus sordide albis flavescentibusve 2–3-seriatis paucis oblongis v. interioribus apice leviter dilatatis minute dentatis fimbriatisve exterioribus linearibus paullo brevioribus, receptaculo nudo floribus ut videtur omnibus ♂, corolla breviter 5-dentata inferne anguste tubulosa, achæniis subteretibus lævibus pilis minutissimis albis dissite notatis, setis pappi caducissimis paucis rigidiusculis barbellatis ovario paullo longioribus.

HAB. South-East Trop. Africa, Nyassaland, *Buchanan* (No. 933).

Folia cum petiolo 2–2½ poll. longa, $\frac{2}{5}$ poll. lata. *Cymæ* terminales congestæ, 2½–3 poll. latæ.

Of the few species of *Helichrysum* with this form of inflorescence—that is, with few-flowered capitula closely disposed in compact cymes—I find none like our present plant, which is also notable in its shrubby habit, with stout stems, leafless below. It is one of the many interesting novelties for which we are indebted to Mr. J. Buchanan, C.M.G., of Blantyre.—D. OLIVER.

Fig. 1. Capitulum. 2, 3. Involucral scales. 4. Floret. 5. Seta of pappus. 6. Anthers. 7. Ovary, corolla removed, and style. 8. Achene. *All enlarged.*

M. S. del. et lith.

Commiphora carvæfolia Oliv.

PLATE 2287.

COMMIPHORA CARYÆFOLIA, Oliv.

BURSERACEÆ.

C. caryæfolia, Oliv. (*sp. nov.*); glaberrima, foliis imparipinnatis, foliolis lateralibus 3-5-jugis oblongo-lanceolatis basi plus minus rotundatis apicem versus angustatis acutiusculis v. acuminatis obtuse- v. crenato-serratis, paniculis præcocibus ad apices ramulorum congestis foliis brevioribus interrupte spiciformibus, ramulis secundariis brevissimis obsoleteve floribus propterea fasciculatim congestis sessilibus v. subsessilibus, drupis ellipsoideis pericarpio exteriori primum carnosulo demum in valvis tribus secedente, pyrenis ellipsoideis leviter compressis osseis, basi carnosulis quasi-arillatis, monospermis (loculo altero abortivo).

HAB. South Africa, Natal, Wood (Nos. 1,046, 1,409, 4,095). Kaffraria, near Komgha, Flanagan (No. 1,107).

Folia 10-14 poll. longa, petiolata; foliola membranacea $2\frac{1}{2}$ -4 poll. longa, $\frac{3}{4}$ - $1\frac{1}{4}$ poll. lata. Paniculæ $1\frac{1}{2}$ -4 poll. longæ. Calyx 4-fidus, segmentis ovatis, æstivatione valvatis. Discus adnatus tubum calycis vestiens. Petala flavescentia, perigyna, calycis tubo inserta, ovata, apice (in alabastro) mucrone incurvo, deinde obovato-elliptica, recurva, acuta. Stamina biseriata, perigyna, margine disci inserta. Ovarii rudimentum (in fl. ♂) minutissimum. Drupa $\frac{2}{3}$ - $\frac{3}{4}$ poll. longa, pyrenis $\frac{1}{2}$ poll. longis osseis, basi carnosulo-incrassatis rubris v. aurantiacis.

I follow Dr. Engler's 'Monograph of Burseraceæ' in adopting *Commiphora* as the generic name of this species, which resembles *C. Harveyi*, Engl.* of Natal more nearly than any other in the Kew Herbarium, though differing from it at first sight in the contraction of the lateral branches of the inflorescence, which has the appearance of an interrupted spike with congested flowers. *C. erythræa*, Engl., the original *Hemprichia* of Ehrenberg, from the Red Sea, has much in common with our species, and the puzzling description of the fruit given by Ehrenberg is quite intelligible on examination of that here figured. He describes the pericarp as 'sesquplex, externum coriaceo-carnosum, . . . 2- ad 4-valve, deciduum; internum dimidiatum, lætissime rubrum, succulentum, . . . arillum mentiens, pyrenas basi

* Indeed, Wood's specimen No. 1,409 is cited by Engler as *C. Harveyi*.

M.S. del. et lith.

Phyllostachya heteroclada Oliv.

PLATE 2288.

PHYLLOSTACHYS HETEROCLADA, *Oliv.*

GRAMINEÆ. Tribe BAMBUSEÆ.

P. heteroclada, *Oliv. (sp. nov.)*; 1–3-pedalis, culmis foliiferis strictis gracilibus ramosis glabris internodiis sæpius $1\frac{1}{2}$ – $2\frac{1}{2}$ poll. longis subteretibus v. inferne semiteretibus, foliis lanceolatis acuminatis basi rotundatis lamina brevissime petiolata glaucescente glabra v. glabrescente margine scabra, vaginis multinerviis glabris hirtisve ore setosofimbriatis, spiculis normaliter 3-floris cum flosculo terminali imperfecto v. in ramulis foliiferis in fasciculos densos sæpius turbinato-hemisphæricos axillares congestis v. in ramis scapisve pedunculatis radicalibus simplicibus v. ramosis aphyllis sed late bracteatis dense fastigiatis, bracteis in inflorescentiis radicalibus late ovato-rotundatis graciliter multinerviis apiculatis fasciculos floriferos subæquantibus gluma florifera lanceolata acuminata ecarinata dorso apicem versus hirsuta inferiore cæteris longiore spicula fere æquilonga 7–9-nerve, palea plus minus bicarinata dorso hirsuta.

HAB. China, Szechuen, *Dr. A. Henry* (No. 8,833); and in a collection from West Szechuen and the Tibetan frontier, chiefly near Tachienlu, 9,000–13,500 feet alt., *Pratt* (No. 384).

Rami aphylli dense floriferi adscendentes 10–12 poll. longi; pedunculi bracteis 2–3 poll. longis vacuis arcte amplexicaulibus vaginati; bracteæ primariæ floriferæ 1 poll. longæ, $1-1\frac{1}{4}$ poll. latæ. *Folia* $1\frac{1}{2}$ –2 poll. longa, 5–7 lin. lata, vagina fasciculo spicularum fere æquilonga. *Antheræ* exsertæ, lineares, obscure mucronulatæ, basi breviter sagittatæ auriculis obtusiusculis. *Stylus* 3-fidus, brachiis gracilibus. *Lodiculæ* 3 obovatæ v. rotundatæ, ciliatæ.

Dr. Henry's specimens reached us—owing, I believe, to his illness at the time—without his usual number and corresponding remark, so that it is difficult to speak with certainty as to the usual dimensions and habit of this interesting plant. The leafy sprays nearly resemble those of a bamboo received from him from Ichang (No. 450), called the 'Water Bamboo,' common there, but not found in water so far as Dr. Henry was aware. Our plant is related to *Phyllostachys nidularia*, *Munro*, in 'Gardeners' Chronicle,' 1876, ii. 774 (*undescribed*), a bamboo then cultivated at Florence. The upper florets of each spikelet appear to be staminate.—D. OLIVER.

Driesseria microthrix, Stapf.

PLATE 2292.

DRIESSENIA MICROTHRIX, *Stapf*.

MELASTOMACEÆ. Tribe OXYSPORÆÆ.

D. microthrix, *Stapf* (*sp. nova*); glabra v. minutissime puberula, caule obscure tetragono, foliis membranaceis petiolatis in eodem jugo valde asymmetricis ovato-oblongis -lanceolatisve longe et oblique acuminatis basi cuneato-rotundatis integerrimis 5-nerviis venis transversis, floribus parvis in cymulis axillaribus subsessilibus 10-15-floribus petiolo subæquilongis dispositis, calycis hemisphærico-cupularis glabri dentibus brevissimis latis inconspicuis, petalis albis late rotundato-ovatis obtusis, staminibus subæqualibus, antheris linearibus obtusis basi antice appendiculis binis subfiliformibus auctis postice breviter calcaratis ovario vertice coronula pyramidata breviter 4-lobata persistente coronato, capsula calyce circumdata 4-valve.

HAB. Borneo, Kinabalu, alt. 3,500 feet, *Haviland*.

Folia 8-10 poll. longa, $2\frac{1}{2}$ -3 poll. lata; *petiolus* $\frac{1}{3}$ - $\frac{1}{2}$ poll. longus. *Pedicelli* $\frac{1}{8}$ - $\frac{1}{6}$ poll. longi, calyce duplo longiores; *bracteæ* minutissimæ.

One leaf of each pair seems to be reduced to a mere rudiment in this species, in which, as in the preceding (*D. glanduligera*), the anthers are nearly or quite equal, and linear and obtuse, not rostrate as in the original species of Korthals (*D. axantha*). In other species they agree in all essentials with the type.—O. STAPF.

Polycline psyllioides, Oliv.

PLATE 2293.

POLYCLINE PSYLLIOIDES, Oliv.

COMPOSITÆ. Tribe ANTHEMIDÆÆ.

Polycline, Oliv. (gen. nov.). *Capitula* homogama, discoidea, ovoidea v. oblongo-ovoidea, 10–20-flora (floribus hermaphroditis), in glomerulos densos, globosos, terminales, squamis paucis ovato-rotundatis oblongisve capitula subtendentibus quasi-involucratos, aggregata. *Receptaculum* angustum, subulatum, paleaceum; paleis scariosis oblongis v. obovato-ellipticis flore paullo brevioribus, concavis v. leviter cymbiformibus, obtusis, apicem versus eroso-fimbriatis. *Corolla* tubo cylindrico, parce glanduloso-papilloso, superne infundibuliforme-dilatato, limbo 5-fido, segmentis lanceolatis recurvis. *Antheræ* basi minute bidentatæ v. brevissime sagittatæ, auriculis per paria coalitis, apice connectivo membranaceo lanceolato productæ. *Styli* rami breves, recurvi, obtusi v. subtruncati. *Achænia* subcylindrica v. plus minus obovoidea, sæpius leviter compressa, nigrescentia, calva v. disco minuto brevissime fimbriato coronata.—*Herbæ erectæ, glabræ, caule aptero, gracili.* Folia alterna, linearia, indivisa. Capitulorum glomeruli ad apices ramorum solitarii, receptaculo communi conico, capitulis singulis exterioribus bractea suffultis.

P. psyllioides, Oliv. (sp. nov.); caulibus erectis, rigidis, costatis, foliis linearibus v. superne leviter dilatatis obtusiusculis basi sensim angustatis, achæniis transversim rugosis.

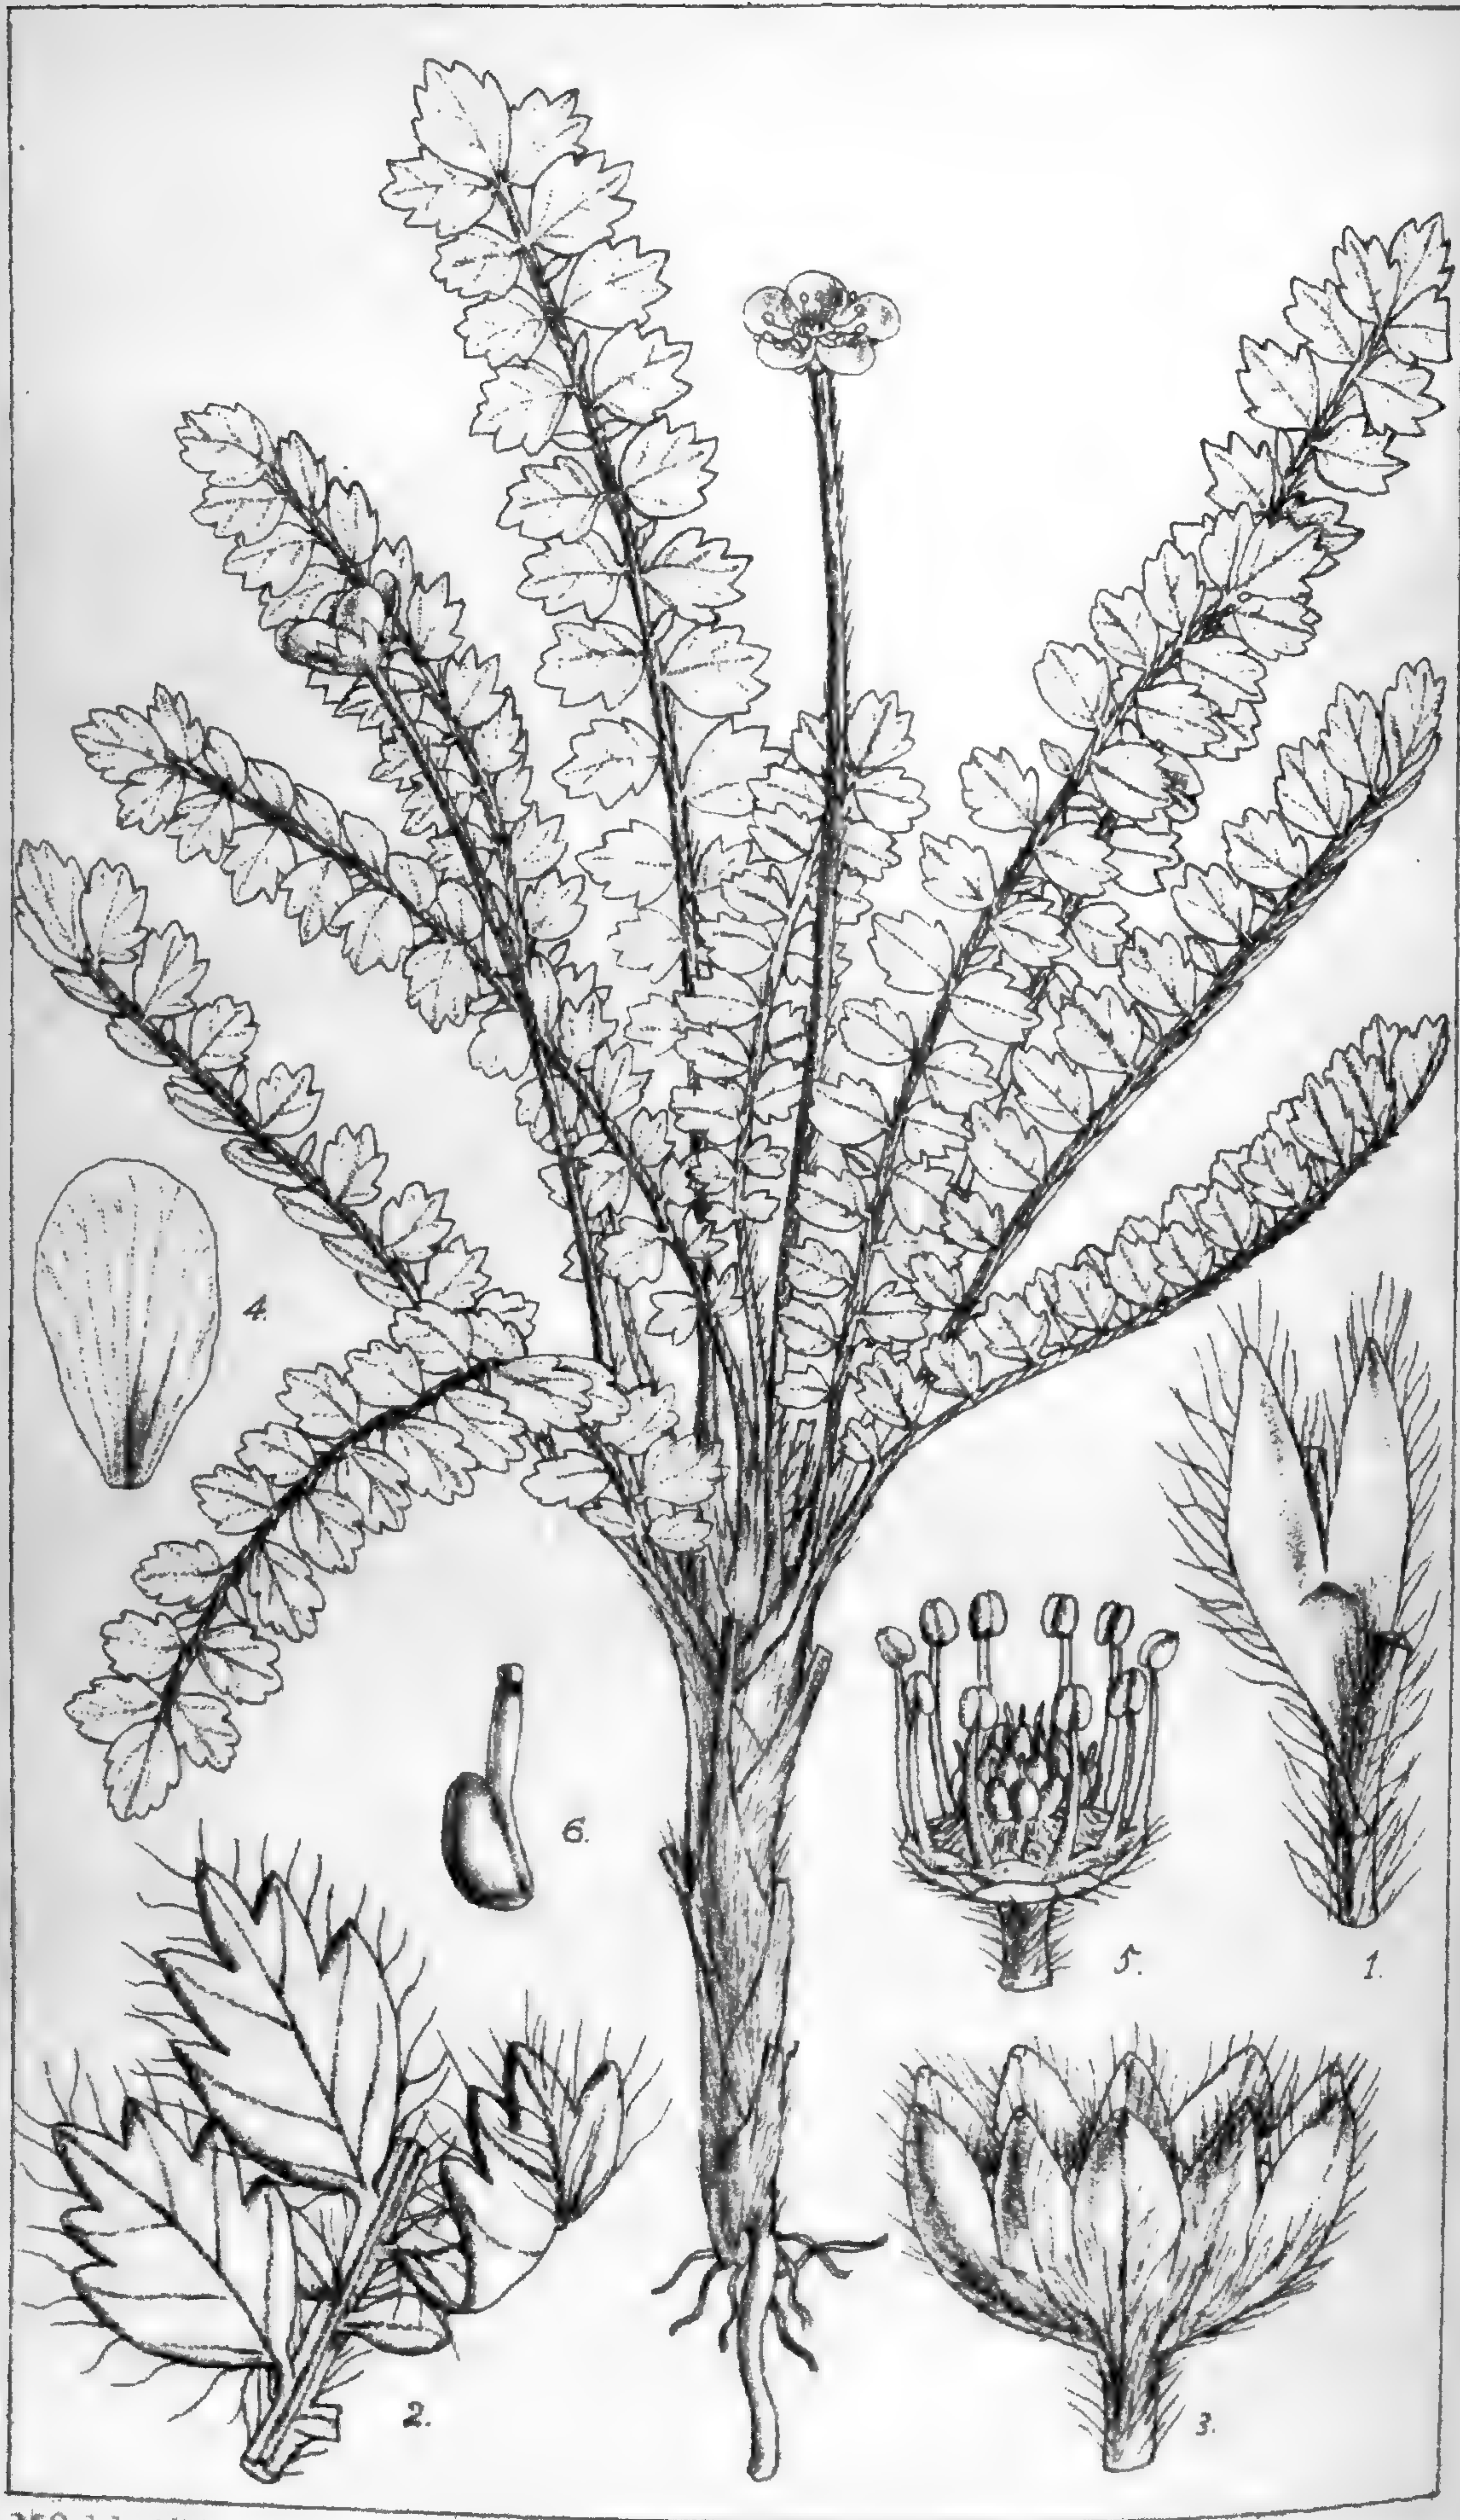

HAB. East Tropical Africa, Kilimanjaro, *Lieut. C. S. Smith.*

Herba $\frac{1}{2}$ - (- $1\frac{1}{2}$ -) pedalis, glaberrima. *Folia* $1-2\frac{1}{4}$ poll. longa, latiora $\frac{1}{4}-\frac{1}{3}$ poll. lata. *Glomeruli* pedunculati, subglobosi, $\frac{1}{2}$ poll. diam.

Congeneric with the above is, no doubt, the plant which I described in the 'Journal of the Linnean Society,' xxi. 400, as *Sphæranthus gracilis*, collected in Masailand, on the Kapté plateau, by Mr. J. Thomson. It may be diagnosed thus:

P. gracilis, Oliv.; glomerulis compactis hemisphæricis, achæniis lævibus parce et minute hirtellis.

Caules $1\frac{1}{2}$ -ped. *Folia* anguste linearia utrinque angustata, 2-3 poll. longa. *Glomeruli* $\frac{1}{2}$ poll. diam.

Pleurostyliia capensis, Oliv.

PLATE 2297.

PLEUROSTYLIA CAPENSIS, Oliv.

CELASTRINEÆ. Subtribe EUONYMEÆ.

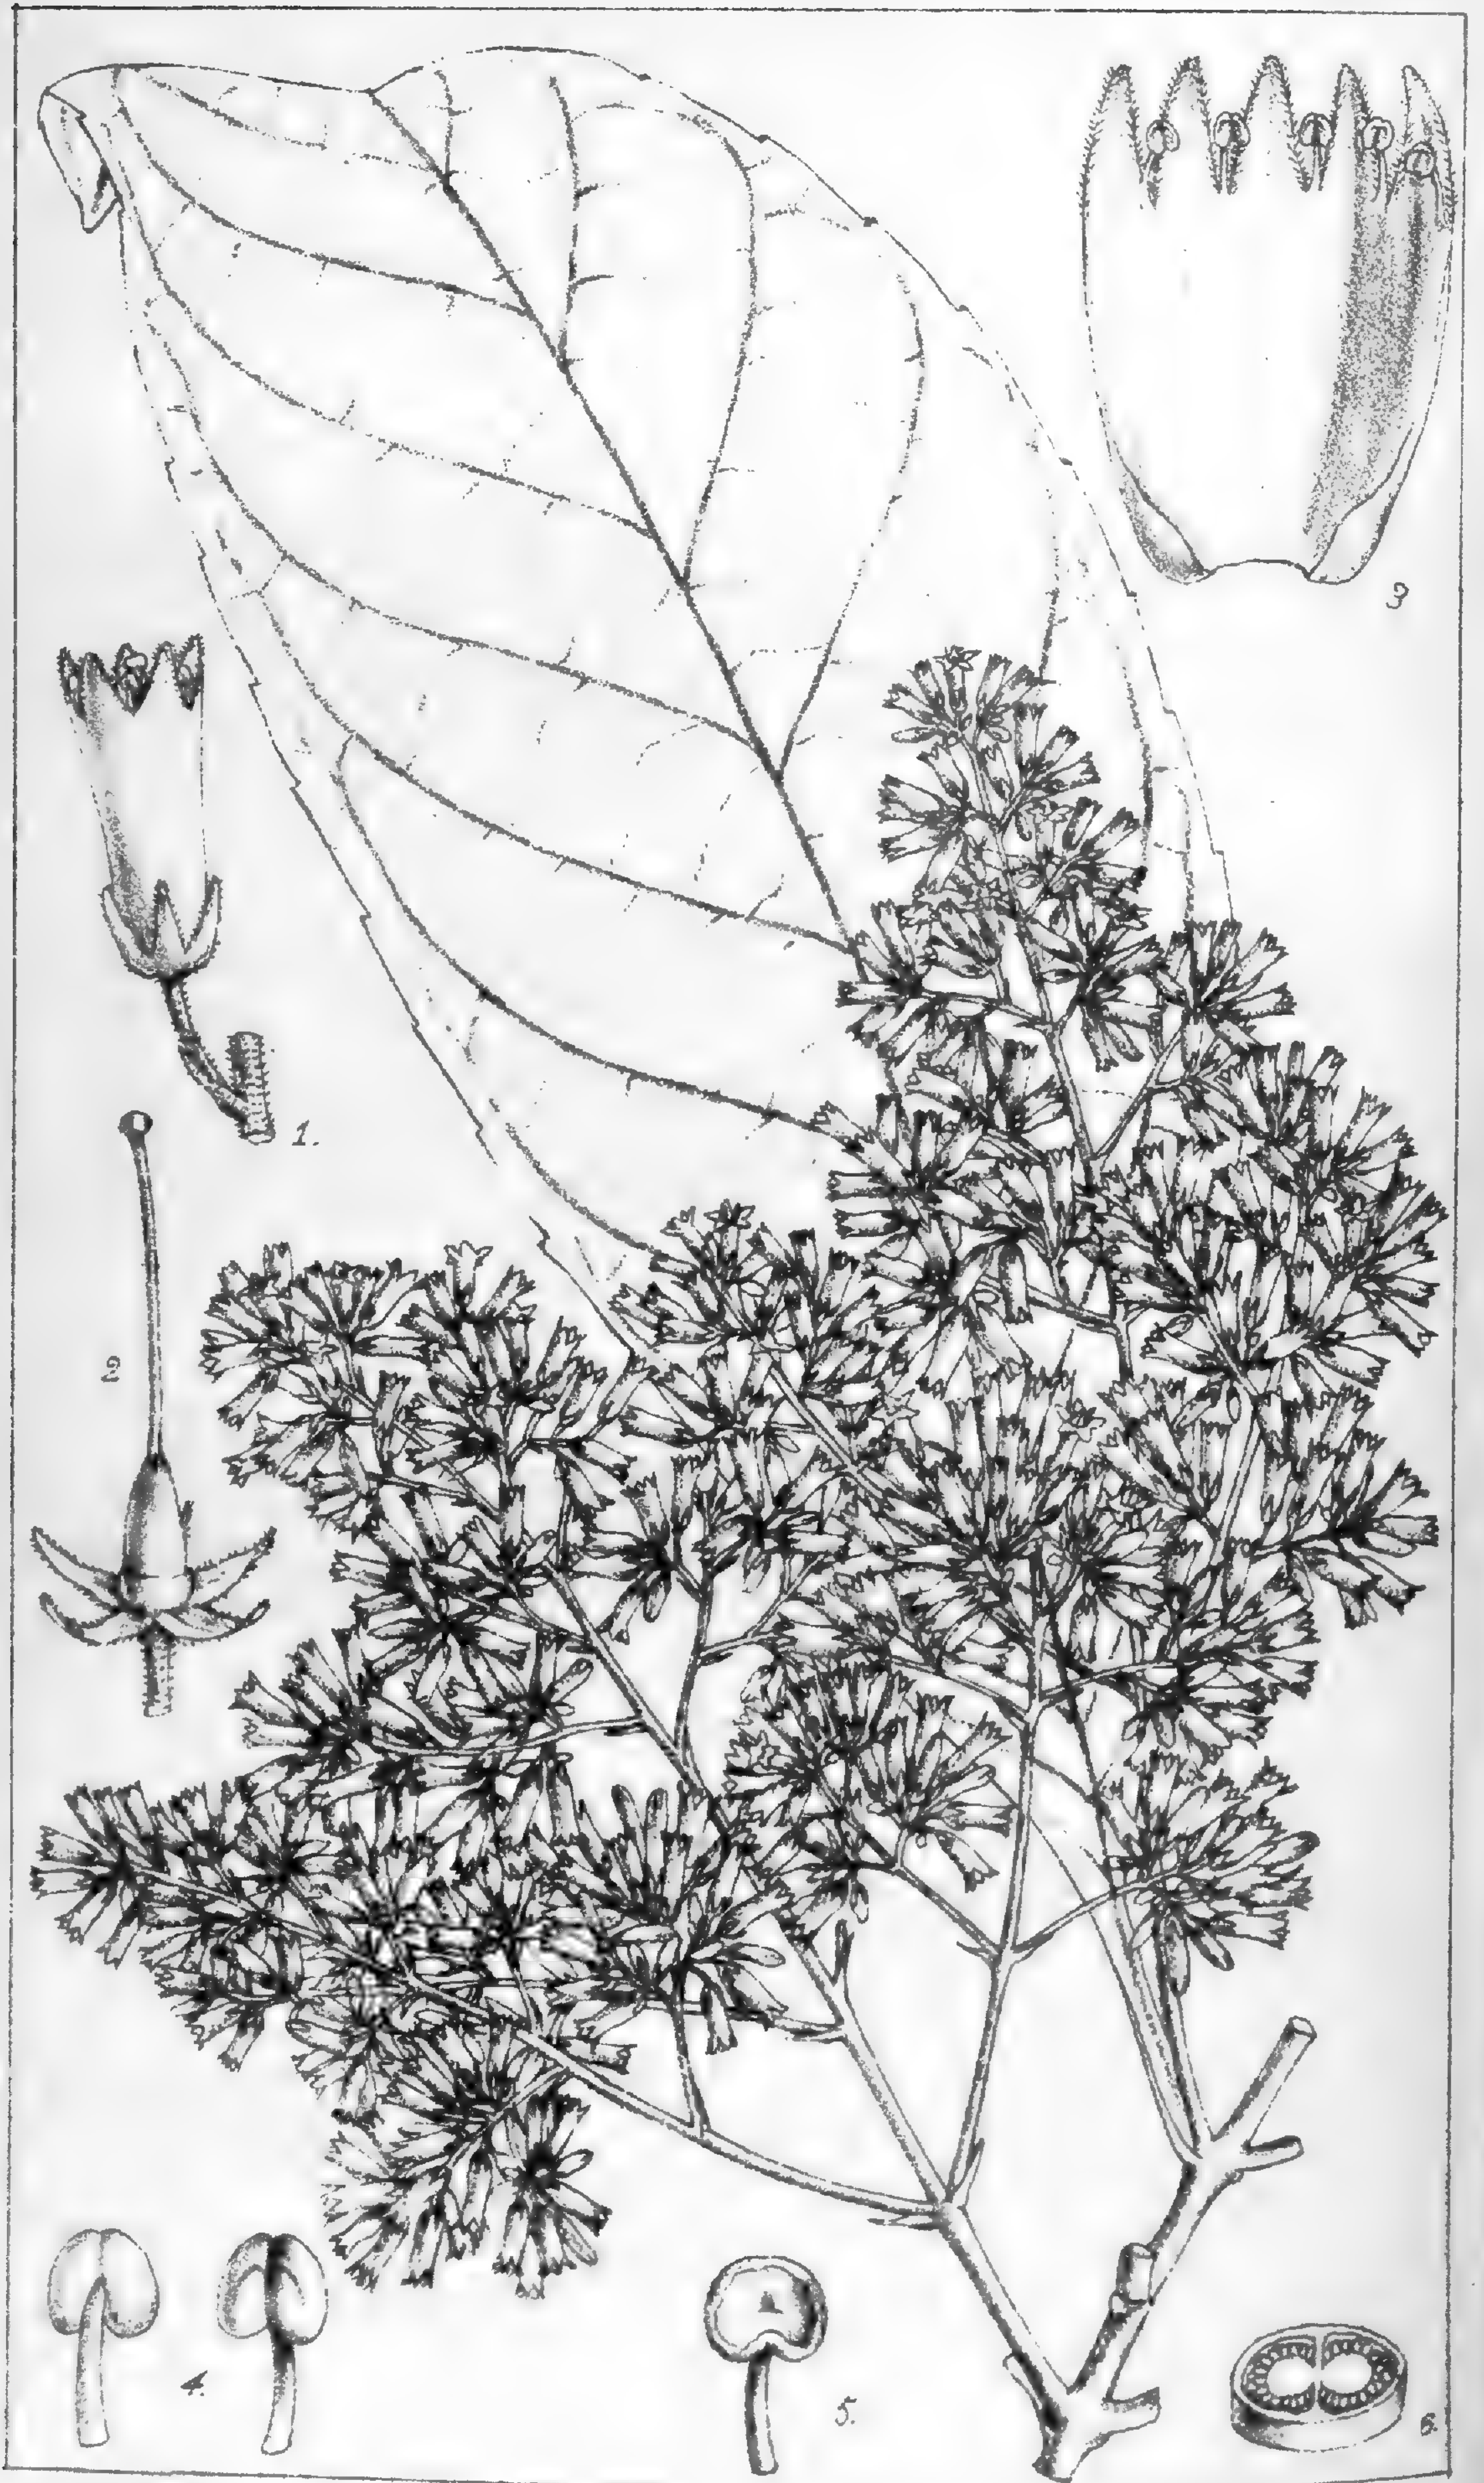

P. capensis, Oliv.; arbor ramosissima glaberrima, ramulis gracilibus, foliis oppositis v. suboppositis tenuiter coriaceis breviter petiolatis venulosis oblongo-ovalibus obtusis basi in petiolum angustatis integerimis v. obsolete repando-crenatis, cymis axillaribus breviter pedunculatis pauci- v. plurifloris umbelliformibus, ovario ovoideo in centro disci crenulati imposito 1-localari 4-5-ovulato, fructu obovoideo (v. immaturo oblique clavato-oblongo), stigmatē sessili infra medium lateraliter notato monospermo, semine exarillato subgloboso, albumine copioso carnosio, embryone viridi longitudine fere seminis, radícula brevi. Cathastrum capense, Turcz. in Bull. Mosc. 1858, i. 448.

HAB. South Africa; Kaffraria, near the Kei River; woods near Komgha, Flanagan (No. 623); Forests in Krakakamma, Zeyher (Celastr. No. 2); Kwelegha, Hutchins; Gerrard (No. 1,596).

Folia $1\frac{1}{2}$ -2 ($-2\frac{1}{2}$) poll. longa, $\frac{2}{5}$ - $\frac{2}{3}$ ($-\frac{3}{4}$) poll. lata. Stipulæ minutissimæ deciduæ. Pedunculī petiolis subæquilongī. Flores 5-meri. Calyx lobis rotundatis eroso-denticulatis, 2 exterioribus minoribus. Petala obovato-rotundata, calyce 2-plo longiora, margine minutissime eroso-denticulata, imbricata. Stamina 5, sub margine disci inserta; filamenta carnosula, glabra, petalis æquilonga; antheræ ovoideæ. Stigma peltato-capitatum, cum sinu laterali. Fructus $\frac{2}{5}$ - $\frac{3}{5}$ poll. longus, pericarpio coriaceo.

Mr. Flanagan's excellent specimens of this plant in fruit and flower—for which we are indebted to Mr. Bolus—I have little hesitation in referring to the genus *Pleurostyliā*, the original species of which belongs to India and Ceylon, while one or two allied species occur in Mauritius and Madagascar. Mr. N. E. Brown further identified them with specimens already in the Herbarium, from Gerrard and Macowan and Bolus (Herb. Norm. 915); referred to Turczaninow's genus *Cathastrum*, described in the absence of fruiting specimens, which must give place to *Pleurostyliā*, which is of much earlier foundation (1834). The ovules in described species of *Pleurostyliā* are said to be geminate: in our plant there are four or five, of which but one matures. Of the arilliform endocarp, 'semen . . . endocarpio arilliformi tectum,' noted in Gen. Pl. i. 364, I find no evidence in *P. capensis*; nor does Tulasne, in his careful description of *P. pachyphlæa*, refer to any endocarp; he simply describes the seed as destitute of an arillus.—D. OLIVER.

Fig. 1. Flower and bracteoles. 2. Expanded flower. 3. Ovary and disk. 4. Longitudinal section of ovary. 5. Carpel with lateral stigma. 6. Same, laid open. 7. Seed. All enlarged.

Peltanthera floribunda, Benth.

PLATE 2298.

PELTANTHERA FLORIBUNDA, *Benth.*

LOGANIACEÆ. Subtribe ANTONIÆÆ.

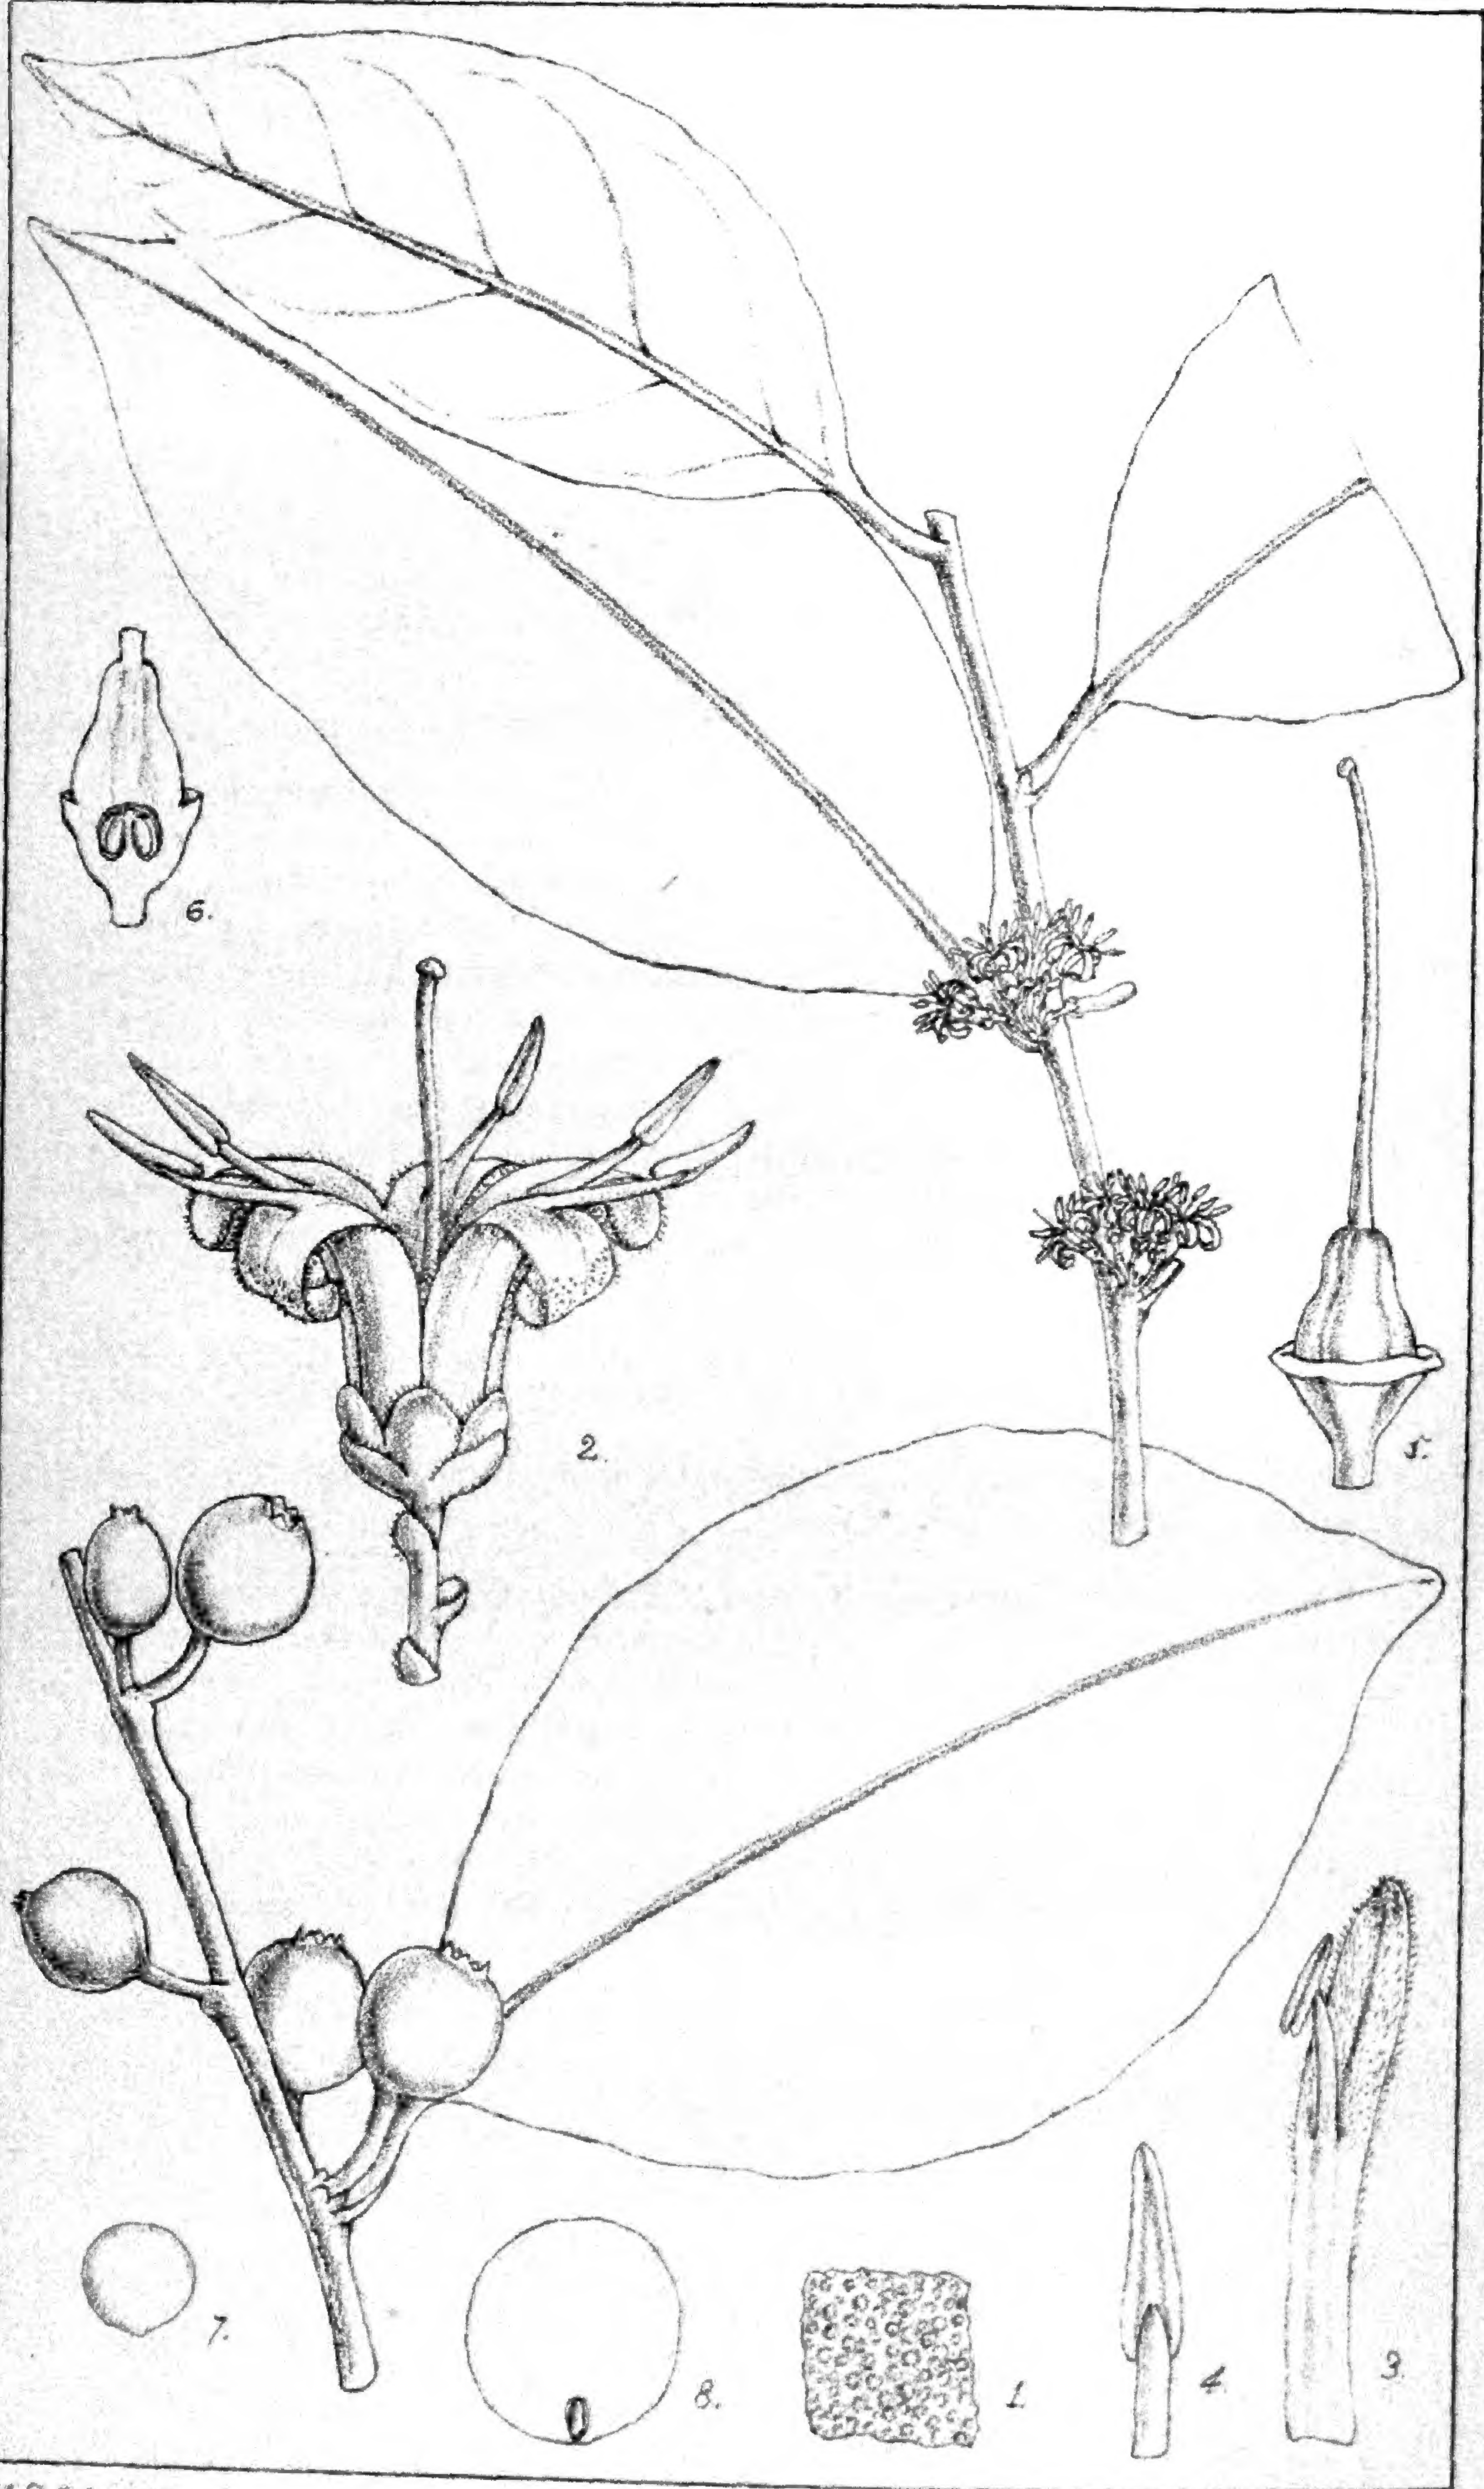

P. floribunda, *Benth. in Gen. Plant.* ii. 797; arbor, foliis oppositis petiolatis membranaceis oblanceolato-ellipticis acute apiculatis in petiolum cuneatim angustatis obscure glanduloso-denticulatis nervis lateralibus utrinque 12-13 costaque subtus prominulis glabratis vernatione subtus tomentellis, paniculis multifloris divaricatis breviter pedunculatis folio brevioribus axillis superioribus ortis, floribus graciliter pedicellatis, bracteis parvis linearibus deciduis, calycis parvi 5-partiti segmentis lanceolatis, corollæ cylindricæ calyce multoties longioris lobis brevibus æstivatione valvatis intus et marginibus breviter tomentellis, filamentis apice liberis corollæ fere æquilongis, antheris parvis ovato-rotundatis post dehiscenciam peltatim affixis, ovario ovoideo in stylum gracilem attenuato cum stylo parce pilosulo, stigmate peltato-discoideo, ovulis indefinitis.

HAB. Peru, Tarapoto, by rocky streams, *Spruce* (No. 4,940).

Arbor 40-pedalis, ramosa, ramulis teretibus glabratis novellis parce tomentellis. *Folia* 6-8 poll. longa, $2\frac{1}{2}$ - $2\frac{3}{4}$ poll. lata; petiolus $\frac{1}{2}$ - $\frac{2}{3}$ poll. longus. *Flores* 'albi, odorati,' 2- $2\frac{1}{2}$ lin. longi.

The only specimens of this interesting species in the Kew Herbarium are the original examples collected by Mr. Spruce in 1857, and first described by Mr. Benthham in the 'Genera Plantarum.' From the same locality Mr. Spruce sent specimens of a form of the same with rather narrower leaves, $1\frac{1}{2}$ -2 inches broad.—D. OLIVER.

Fig. 1. Flower. 2. Calyx and pistil. 3. Corolla, laid open. 4. Stamen, back and front. 5. Anther, after dehiscence. 6. Transverse section of ovary. *All enlarged.*

M.S. del, et lith.

Strombosia pustulata, Oliv.

PLATE 2299.

STROMBOSIA PUSTULATA, Oliv.

OLACINEÆ. Tribe OLACEÆ.

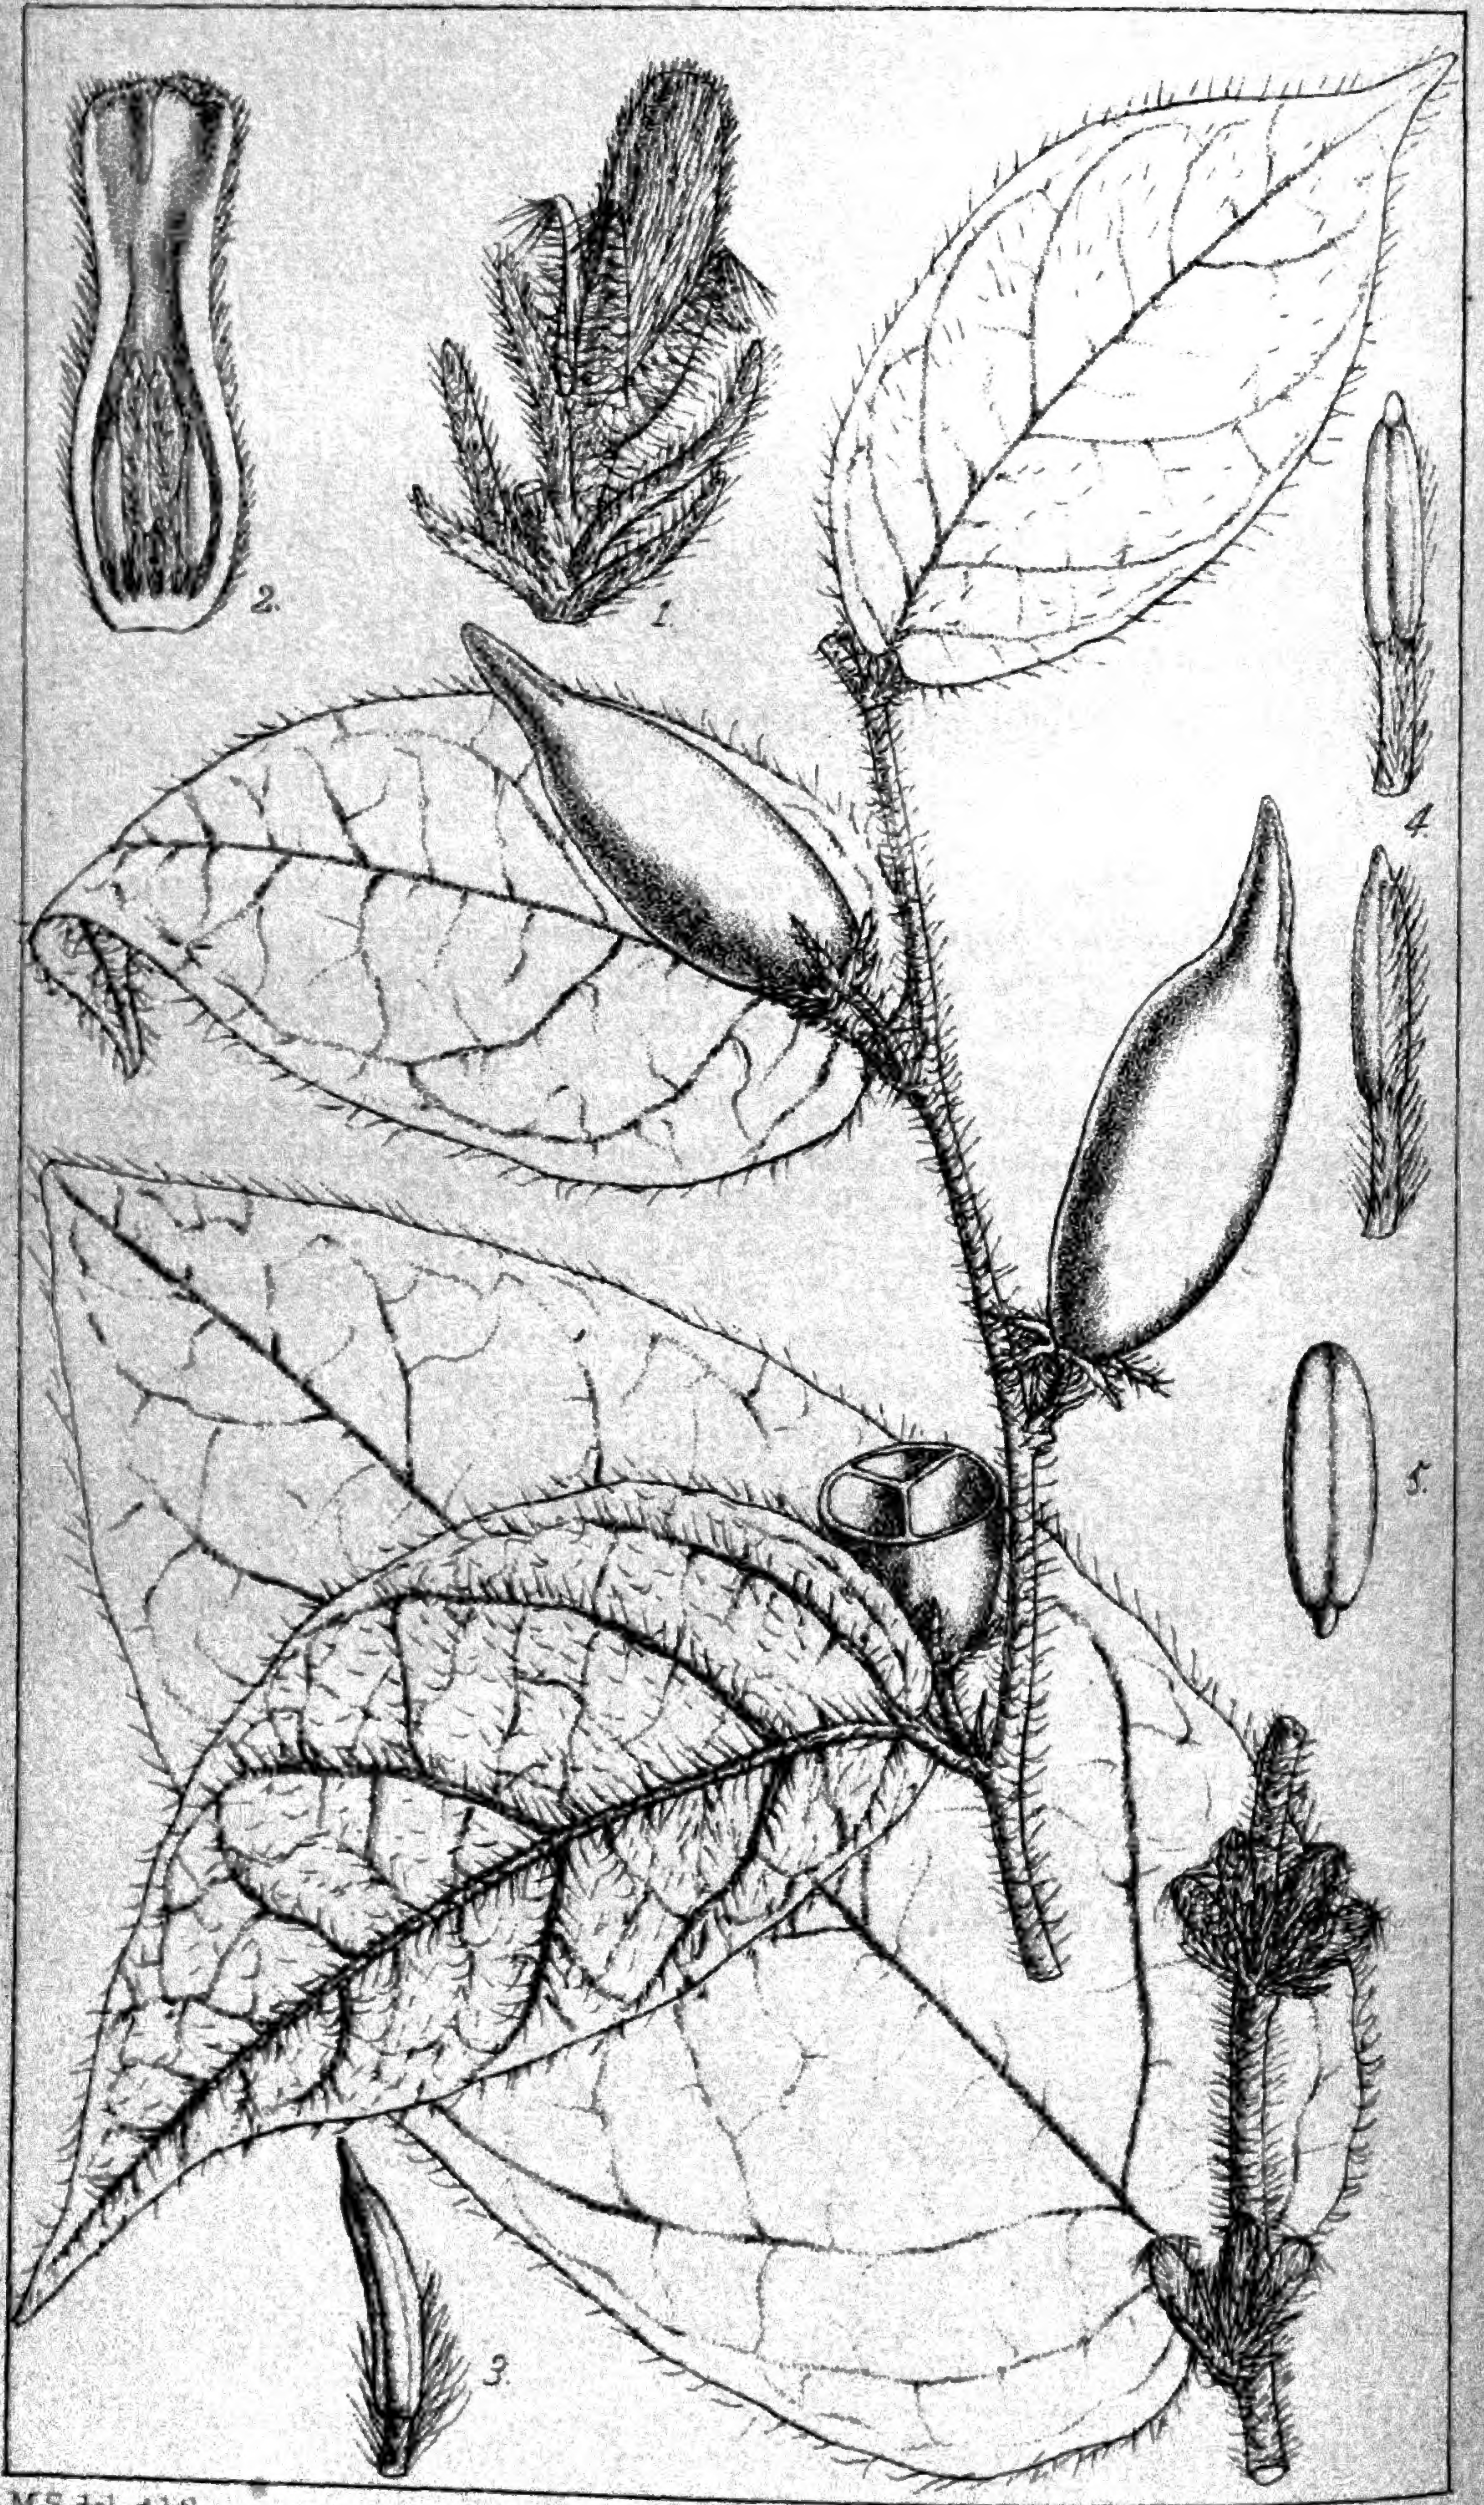

S. pustulata, Oliv. (*sp. nov.*); glaberrima, ramulis teretibus, foliis petiolatis oblongo- v. ovali-ellipticis breviter acuminatis sæpe obtusiusculis costa in mucronem terminante supra (sub lente) minute pustulatis nervis inconspicuis, subtus nervis lateralibus utrinque 4-6 leviter prominentibus, cymis axillaribus sessilibus petiolis æquilongis, floribus pedicellatis, pedicellis bracteolatis bracteolis parvis rotundatis, sepalis parvis late ovatis obtusis, petalis lineari-oblongis supra medium recurvis margine et facie interiori apicem versus pilosulis, staminibus petalis adnatis et fere æquilongis, ovario apice carnosio libero ovoideo in stylum staminibus æquilongum abrupte angustato, cavitate ovulifera infera, fructibus subglobosis lobis calycinis marcidis apice coronatis.

HAB. West Tropical Africa, near Lagos, *Rowland*; Sierra Leone Boundary Commission, near Kambia, *Scott-Elliot* (No. 4,733).

Folia $3\frac{1}{2}$ -4 poll. longa, $1\frac{1}{2}$ -2 poll. lata, subcoriacea; *petiolus* $\frac{3}{10}$ poll. longus. *Fructus* $\frac{1}{3}$ - $\frac{1}{2}$ poll. diam.

The only other described Tropical African Olacinea ascribed (with a ?) to *Strombosia* in the Kew Herbarium is *S. grandifolia*, Hook. f., of which we have no fruiting specimens. The leaves are much longer (5-8 inches long) than in *S. pustulata*, the lateral nerves conspicuous above and below, with approximately parallel transverse veins, and there is no trace of the minute pustuliform spots on the upper surface, readily found under a lens in *S. pustulata*, due probably to moulding of the dry tissues of the leaf over cystolithic concretions.—D. OLIVER.

Fig. 1. Portion of leaf, showing upper surface. 2. Flower. 3. Petal and antiposed stamen. 4. Anther, from back. 5. Pistil. 6. Longitudinal section of pistil. 7. Seed. 8. Vertical section of same. *Excepting fig. 7, enlarged.*
